satelettronica

Technical information should always be available to the foremen and mechanics, because their careful and constant adherence to the instructions is essential to ensure vehicle road-worthiness and safety. In addition, the normal basic safety precautions for working on motor vehicles must, as a matter of course, be observed.

01 - Self-diagnosis

1 - General to self-diagnosis

1.1 - General to self-diagnosis

1.2 - Features of self-diagnosis

The Simos control unit (J361) for the fuel injection and ignition system is equipped with a fault memory.

If faults occur in the sensors and components being monitored, they will be stored in the fault memory together with an indication of the type of fault.

After evaluating the information, the engine control unit decides among different faults => Fault table page 16 and stores these until the contents of the fault memory is erased.

Faults which only occur sporadically will have the addendum "sporadic fault" on the print out. These faults will be indicated on the display by the addendum "/SP". The cause of sporadic faults can be e.g. a loose contact or a brief open circuit. If a sporadic fault does not occur again within 40 engine starts, it will be erased from the fault memory.

The faults stored can be read-out with the fault reader V.A.G 1551, the vehicle system tester V.A.G 1552 or the new tester VAS 5051 => Page 10 .

The fault memory must be erased after the faults have been rectified => Page 10 .

Note:

General information for self-diagnosis can be found in the instruction manuals for the fault reader V.A.G 1551, vehicle system tester V.A.G 1552 or the new tester VAS 5051.

1.3 - Technical data of self-diagnosis

Control unit identification

The control unit version is displayed when the fault reader V.A.G 1551, the vehicle system tester V.A.G 1552 or the new tester VAS 5051 is connected and engine electronics control unit selected => Page 4 .

Equipment

Engine code	APF	AUR
System designation	SIMOS 3.3	SIMOS 3.3
Exhaust emissions fulfil	D4 standard	EURO IV
Exhaust emissions warning lamp	no	yes
EPC system	yes	yes
Self-diagnosis	yes	yes
Final control diagnosis	yes	yes
Operating mode of data transfer to V.A.G 1551/1552	Rapid data transfer	Rapid data transfer
Control unit coding	V.A.G 1551/1552 or VAS 5051	V.A.G 1551/1552 or VAS 5051

Copyright by Volkswagen AG. Volkswagen AG does not guarantee or accept any liability with respect to the correctness of information in this document. Copyright by Volkswagen AG. Reproduced by copyright. Copying for private or commercial purposes, part or in whole, is not permitted unless authorised by Volkswagen AG.
satelettronica

Engine code	APF	AUR
Fault memory	Non-volat. mem.1)	Non-volat. mem.1)
Memory for learnt values	Non-volat. mem.1)	Non-volat. mem.1)
Lambda regulation	2 probes	2 probes
Knock control	1 knock sensor	1 knock sensor
Variable intake manifold	yes	yes
Secondary air system	yes	yes
Exhaust gas recirculation	yes	yes

1) Independent of voltage supply.

Functions which can be selected when using the fault readers V.A.G 1551/1552 or VAS 5051

Note:

The prerequisites to select the desired functions can be found in the following table.

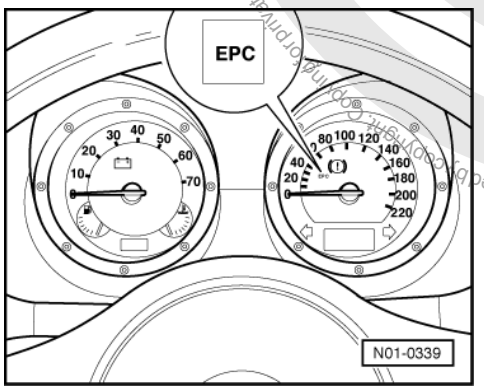
Function		Prerequisite		
Functions on fault reader V.A.G 1551 or on system tester V.A.G 1552		Engine stopped, ignition switched on	Engine running at idling speed	Vehicle being driven
01	Interrogate control unit version	yes	yes	yes
02	Interrogate fault memory	yes1)	yes	yes
03	Final control diagnosis	yes	no	no
04	Basic setting2)	yes	no	no
05	Erase fault memory	yes1)	yes	yes
06	End output	yes	yes	yes
07	Code control unit	yes	no	no
08	Read measured value block	yes	yes	yes
10	Adapting	yes	no	no
11	Login procedure	yes	no	no

1) Only carry out with ignition switched on, when engine does not start (operate starter for at least 5 seconds first).

2) Must be carried out after performing the following work: Replacing engine control unit, throttle valve control part, exhaust gas recirculation valve or engine.

1.4 - Significance of EPC warning lamp (fault lamp for electronic accelerator) in dash panel insert

"EPC" is the abbreviation for Electronic Power Control.



Protected by copyright. Copyright by Volkswagen AG. Volkswagen AG does not guarantee or accept any liability with respect to the correctness of information in this document. Copyright by Volkswagen AG. Reproduced for private or commercial purposes in part or whole is not permitted unless authorised by Volkswagen AG.
satelettronica

-> Fitting location of EPC warning lamp

When the ignition is switched on the engine control unit checks all components which are important for the correct functioning of the electronic power control.

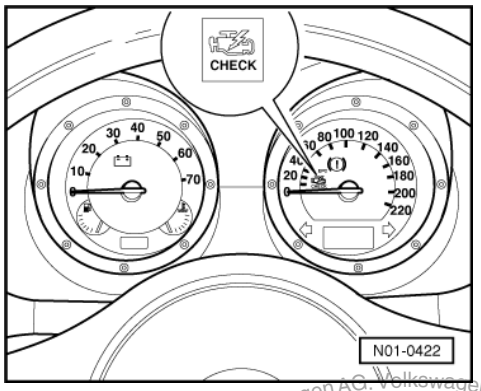
If no faults are detected in the electronic accelerator (EPC system), the engine control unit switches the EPC warning lamp off after the engine has started.

If faults are detected in electronic accelerator system when the engine is running, the engine control unit will switch on the EPC lamp (these faults are marked in the fault table). Simultaneously an entry is made in the engine control unit fault memory.

1.5 - Significance of exhaust emissions warning lamp

Only vehicles with on-board diagnosis

If the engine control unit detects a fault this is indicated by switching the exhaust emissions warning lamp on.



-> Location of exhaust emissions warning lamp

Note:

The exhaust emissions warning lamp can switch on in the continuous or flashing mode. Always interrogate fault memory => Page 10 .

- Flashing mode: There is a fault present which can damage the catalyst when continuing to drive at this power output. If this occurs, continue driving only at reduced output.
- Continuous mode: There is a fault present which causes the emissions to deteriorate. Interrogate engine or gearbox control unit in this case.
- Interrogate the fault memory if the customer has a complaint or there is a driving characteristic problem and the exhaust gas warning lamp does not light up, this is because faults can be stored which will not switch the exhaust gas warning lamp on immediately.

Functional check:

- Switch on ignition:
  the exhaust emissions warning lamp must light-up.

If the exhaust emissions warning lamp does not light-up with ignition switched on:

- Check combi-instrument and exhaust emissions warning lamp as follows:

=> Electrical system self-diagnosis; Repair group 01

If the exhaust emissions warning lamp lights-up with ignition switched on, continue check as follows:

Protected by copyright. Copying for private or commercial purposes, in part or in whole, is not permitted unless authorised by Volkswagen AG. Volkswagen AG does not guarantee or accept any liability with respect to the correctness of information in this document. Copyright by Volkswagen AG.

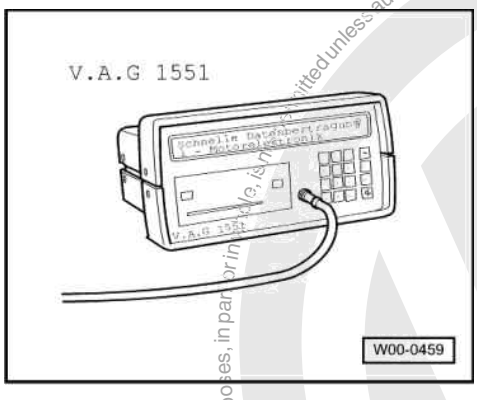
satelettronica

- Start engine and run at idling speed:
  The exhaust emissions warning lamp must go out after a few seconds.

If the exhaust emissions warning lamp does not go out:

- Interrogate fault memory, if necessary, repair any faults and then erase fault memory => Page 10 , interrogating and erasing fault memory.

1.6 - Connecting fault reader V.A.G 1551 and selecting engine control unit

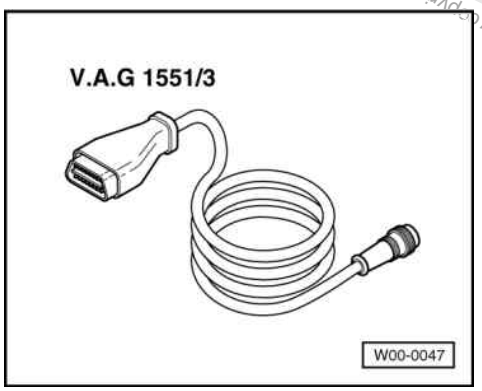


Special tools, workshop equipment, testers, measuring instruments and auxiliary items required

- V.A.G 1551 Fault reader

Notes:

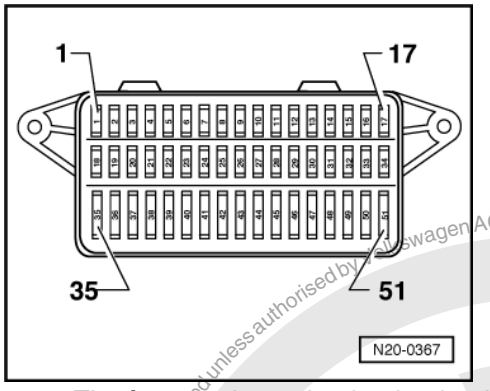
- The vehicle system tester V.A.G 1552 can be used instead of the fault reader V.A.G 1551, however a print-out is not possible.
- All functions of V.A.G 1551/1552 can also be carried out with the new tester VAS 5051. Connecting VAS 5051 => Page 6 .



- V.A.G 1551/3 Cable

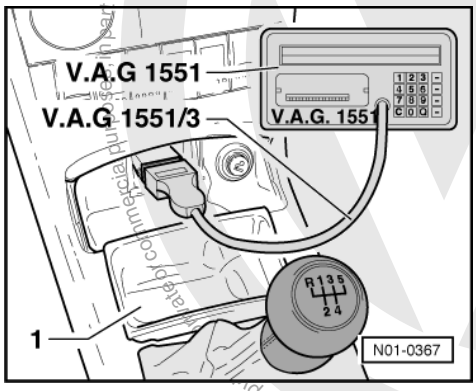
Protected by copyright. Copying for private or commercial purposes, in part or in whole, is not permitted unless authorised by Volkswagen AG. Volkswagen AG does not guarantee or accept any liability with respect to the correctness of information in this document. Copyright by Volkswagen AG.
satelettronica

Test conditions



- -> The fuses 1, 3, 15, 24, 27, 31, 34, 36 and 40 must be OK.
- Earth connection in plenum chamber OK.
- The battery voltage must be at least 11.5 V.
- All electrical consumers, e.g. lights and rear window heating must be switched off.
- If the vehicle is equipped with an air conditioning system, this must be switched off.

Work sequence



- -> Remove ash tray -1-.
- Connect fault reader V.A.G 1551 with cable V.A.G 1551/3.

After the fault reader has been connected:

- Depending upon desired function:
  Switch ignition on
  or
  Start engine => Page 2 , Table "Selectable functions".

Notes:

◆ If the display remains blank, check voltage supply for diagnostic connection:

=> Current flow diagrams, Electrical fault finding and Fitting locations

◆ If the display does not indicate as described in the work sequence:

=> Fault reader operating instructions

◆ If due to an input fault "Fault in the data transfer!" is displayed, pull wire off fault reader, reconnect and repeat work step.

- Operate fault reader taking into account the information on the display:

-> Indicated on display:

Reproduced by copyright holder, unless authorised by Volkswagen AG. Volkswagen AG does not guarantee or accept any liability with respect to the correctness of information in this document. Copyright by Volkswagen AG.
satelettronica

```
V.A.G - SELF DIAGNOSIS     HELP
     1 - Rapid data transfer*
     2 - Flash code output*
```

* Appears alternately

- Operate fault reader taking into account the information on the display:
- Press key 1 for "Rapid data transfer".
- Press keys 0 and 1 for address word "Engine electronics" and confirm entry with Q key.

-> The control unit identification and the coding are indicated on the display, e.g.:

```
6K0906033A
```

- 6K0 906 033A = Part No. of control unit (for latest control unit versions see parts catalogue)
- 1.6 ltr. = Engine displacement
- 2V = 2-valve
- SIMOS 3 = System designation
- 00 = No. of changed adaption channels
- HS = Manual gearbox (hand change)
- S105 = Programme level number
- Coding 00011 = Control unit coding, coding variants of engine control unit => Page 147 .
- WSC xxxxx = Workshop code from V.A.G 1551, of the workshop which carried out the last coding. (If the factory coding has not been changed, WSC 00000 appears)

Notes:

- Replace control unit if the control unit version displayed does not correspond to the vehicle => Page 145 .
- Check to see if the correct coding has been used if there are driving characteristic problems/malfunctions => Page 147 .

- Press ⇒key.

-> Indicated on display:

```
Rapid data transfer      HELP
Select function XXX
```

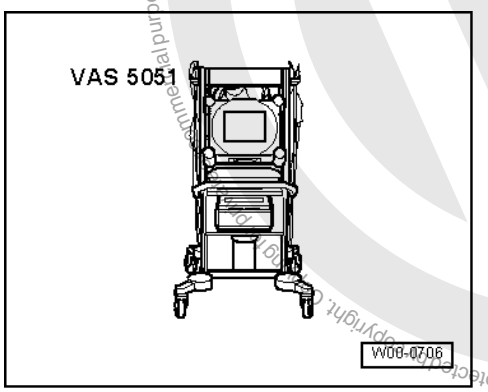
- Further measures see repair procedures.

1.7 - Connecting vehicle diagnosis, testing and information system VAS 5051 and selecting engine control unit

All functions which could be done with V.A.G 1551/1552 can also be done with the new tester VAS 5051 in the operating mode: "vehicle self-diagnosis":

=> Operating instructions for Vehicle Diagnosis, Testing and Information System VAS 5051.

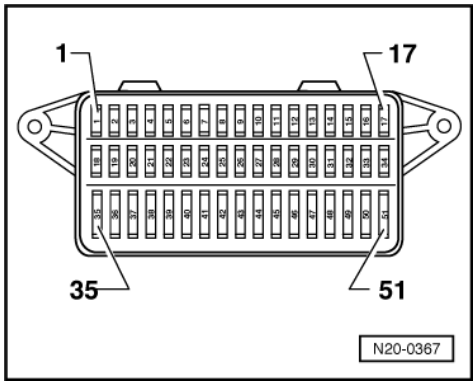
Special tools, workshop equipment, testers, measuring instruments and auxiliary items required



Protected by copyright. Copyright by Volkswagen AG. Copyright by Volkswagen AG. Volkswagen AG does not guarantee or accept any liability with respect to the correctness of information in this document. Copyright by Volkswagen AG. Reproduction, in part or in whole, is permitted unless authorised by Volkswagen AG.
satelettronica

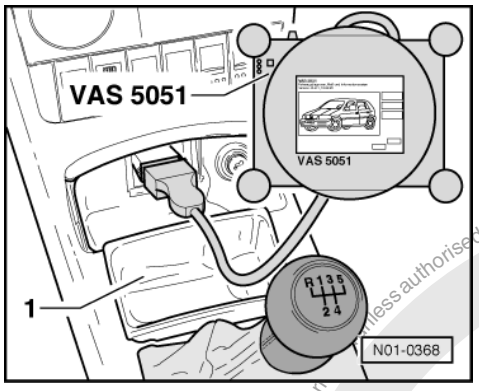
- VAS 5051 Vehicle Diagnosis, Testing and Information System

Test conditions



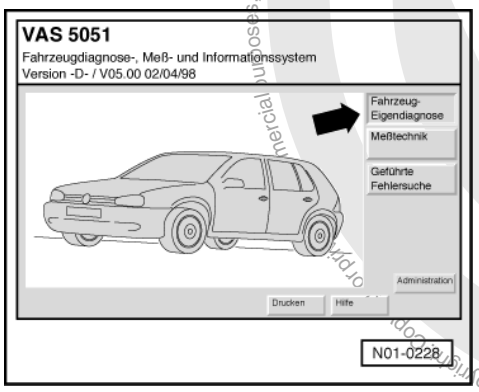
- -> The fuses 1, 3, 15, 24, 27, 31, 34, 36 and 40 must be OK.
- Earth connection in plenum chamber OK.
- The battery voltage must be at least 11.5 V.
- All electrical consumers, e.g. lights and rear window heating must be switched off.
- If the vehicle is equipped with an air conditioning system, this must be switched off.

Work sequence



- Connect the tester VAS 5051 using diagnostic cable VAS 5051/1 or VAS 5051/3 as follows:
- -> Remove ash tray -1-.
- Fit diagnosis cable connector onto diagnosis connector.

- Depending upon desired function:
  Switch ignition on
  or
  Start engine => Page 2 , Table "Selectable functions".



Protected by copyright. Copyright by Volkswagen AG.
Copyright by Volkswagen AG. Volkswagen AG does not guarantee or accept any liability with respect to the correctness of information in this document.
satelettronica

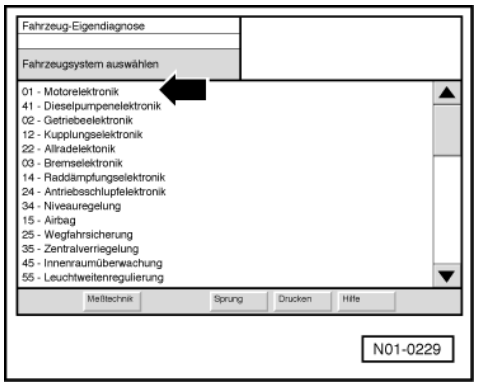
Notes:

- In the functions 04 - Basic setting/08 - Read data block, the display zones will be listed from top to bottom.
- If the display does not indicate as described in the work sequence:

=> Operating instructions for Vehicle Diagnosis, Testing and Information System VAS 5051.

-> Indicated on display:

Select operating mode:

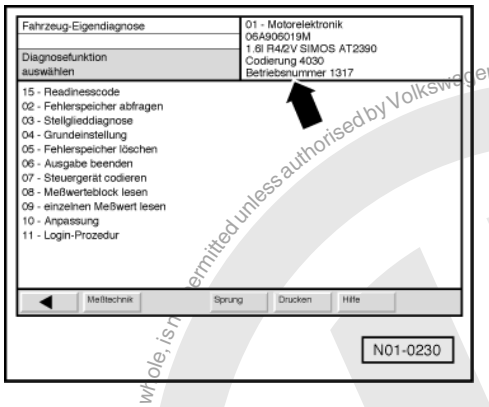


- Press the button on the display for "Vehicle self-diagnosis" -arrow-.

-> Indicated on display:

Select vehicle system:

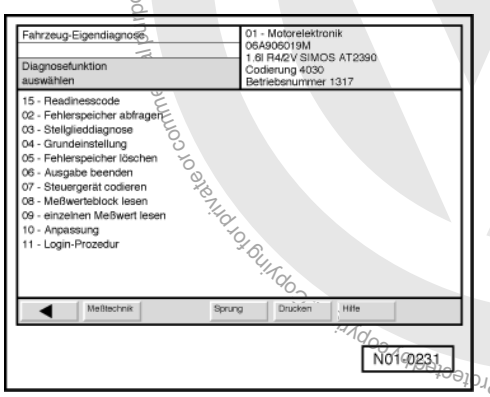
- Press keys "01 - Engine electronics" on the display -arrow-.



-> On the display the control unit identification and coding are displayed, e.g.:

If the coding differs from the vehicle version, then:

- Checking control unit coding => Page 147 ,
  coding variations for engine control unit.



Protected by copyright. Copying for private or commercial purposes, in part or in whole, is not permitted unless authorised by Volkswagen AG. Volkswagen AG does not guarantee or accept any liability with respect to the correctness of information in this document. Copyright by Volkswagen AG.
satelettronica

-> Indicated on display:

Select diagnostic function:

At this point all diagnostic functions are available.

- Press the desired function on the display.
- Further measures see repair procedures.

2 - Fault memory

2.1 - Fault memory

Interrogate and erase engine control unit fault memory=> Page 10 .

2.2 - Automatic test sequence for interrogating all fault memories

Special tools, workshop equipment, testers, measuring instruments and auxiliary items required

- Fault reader V.A.G 1551 (or vehicle system tester V.A.G 1552) with cable V.A.G 1551/3

Work sequence

Note:

All functions which could previously be performed with V.A.G 1551/1552 can also be performed with the new tester VAS 5051.

The various control units/components are connected together via a data bus. This is why it is always sensible to interrogate the fault memory of all control units first with the "automatic test sequence".

During test and assembly work faults can be recognised from other control units like e.g. plug disconnected. Therefore on completion the fault memories of all control units must be interrogated and erased. To do this:

- Press key 0 twice for address word "Automatic test sequence" and confirm entry with Q key. The V.A.G 1551 transmits all known address words one after the other.

When a control unit answers with its identification the number of stored faults appears on the display or "No fault recognised".

Any system faults that are stored will be displayed one after the other and printed out. The V.A.G 1551 will then transmit the next address word.

-> The automatic test sequence has ended when the following appears on the display:

```
V.A.G - SELF-DIAGNOSIS     HELP
1 - Rapid data transfer*
2 - Flash code output*
```

- Erase all fault memories and then carry out a road test.

Observe the valid safety measures during a test drive => Page 48 .

During the road test the following operating conditions must be fulfilled:
- The coolant temperature must exceed 80 °C .

- When the temperature is reached, the operating conditions
  Idling
  Part throttle
  Enrichment

satelettronica

Full throttle
Overrun
must be attained several times.
- At full throttle the speed must exceed 3500 rpm.

Again interrogate the fault memories of all control units using the "automatic test sequence".

If no fault is stored:

- Press the ⇒key.

-> Indicated on display:

```
Rapid data transfer     HELP
Select function XX
```

- Press keys 0 and 6 for the function "End output" and confirm entry with the Q key.
- Switch off ignition.

2.3 - Interrogating and erasing engine control unit fault memory

Special tools, workshop equipment, testers, measuring instruments and auxiliary items required

◆ Fault reader V.A.G 1551 (or vehicle system tester V.A.G 1552) with cable V.A.G 1551/3

Note:

All functions which could previously be performed with V.A.G 1551/1552 can also be performed with the new tester VAS 5051.

Work sequence

- Connect fault reader V.A.G 1551 (V.A.G 1552). Start engine and select "Address word" 01 of engine control unit. When doing this the engine must be running at idling speed.
  (Connecting fault reader and selecting engine control unit => Page 4 .)

Only when engine does not start:

- Operate the starter for at least 5 seconds. Then do not switch the ignition off.

- Switch on fault reader printer with the print key. The warning lamp in key must light up.

-> Indicated on display:

```
Rapid data transfer     HELP
Select function XX
```

- Operate fault reader taking into account the information on the display:
- Press keys 0 and 2 for function "Interrogate fault memory" and confirm entry with Q key.

-> The number of faults stored or "No fault recognised!" will be shown on the display.

```
X Faults recognised!
```

If no fault is stored:

- Press ⇒key.

If one or more faults are stored:

The stored faults will be displayed and printed out one after the other.

-> After the stored faults have been printed out, the display will show:

Protected by copyright. Copying for private or commercial purposes, in part or in whole, is not permitted unless authorised by Volkswagen AG. Volkswagen AG does not guarantee or accept any liability with respect to the correctness of information in this document. Copyright by Volkswagen AG.
satelettronica

```
Rapid data transfer      HELP
Select function XX
```

- Press keys 0 and 5 for the function "Erase fault memory" and confirm entry with Q key.

-> Indicated on display:

```
Rapid data transfer
Fault memory is erased!
```

Note:

If the ignition is switched off between "Interrogate fault memory" and "Erase fault memory" the fault memory will not be erased.

- Press ⇒key.

-> Indicated on display:

```
Rapid data transfer      HELP
Select function XX
```

- Press keys 0 and 6 for the function "End output" and confirm entry with the Q key.
- Switch off ignition.
- Rectify faults printed out using fault table:
  SAE P0 codes=> Page 16

Note:

If an emissions test is to be performed after the fault memory is erased, generate readiness code => Page 41 .

3 - Fault table: SAE P0 codes

3.1 - Fault table: SAE P0 codes

Notes:

- The fault code overview is listed according to SAE or V.A.G code.
- Electronic accelerator "EPC" relevant faults are indicated additionally by the electronic accelerator warning lamp ("EPC warning lamp") in dash panel insert.
- Explanation of the fault types (e.g. "open circuit/short circuit to earth"):

=> Fault reader operating instructions

- If components are indicated as faulty:
  First check the wiring and connectors to these components as well as the system earth connections according to current flow diagram. This is particularly relevant if faults are output as "occurring sporadically" (SP).
- Erase fault memory after rectifying fault =>Page 10 .

V.A.G 1551 print out, e.g.:

16497 P0113 035

Intake air temperature sender -G42

Signal too large

Sporadic fault

Protected by copyright. Copying for private or commercial purposes, in part or in whole, is not permitted unless authorised by Volkswagen AG. Volkswagen AG does not guarantee or accept any liability with respect to the correctness of information in this document. Copyright by Volkswagen AG.
satelettronica

Explanation:

- 16497 = Fault code
- P0113 = Additional fault code (only for USA at present and disregard)
- 035 = Fault type as a number
- Intake air temperature sender -G42 = Faulty current path or incorrect location
- Signal too large = Fault type as text
- Sporadic faults = Faults that are not always present e.g. loose contact

Fault code		Fault text	Fault elimination

Fault code		Fault text	Fault elimination
SAE	V.A.G		
P0300	16684	Misfiring recognised	- Check injectors=>Page 118 - Check ignition cables and spark plugs => Page 171 - Check ignition transformer => Page 177 - Check misfiring detection => Page 183
P0301	16685	Cyl. 1 Misfiring recognised	
P0302	16686	Cyl. 2 misfiring recognised	
P0303	16687	Cyl. 3 misfiring recognised	
P0304	16688	Cyl. 4 misfiring recognised	

Note:

For faults in the ignition outputs of the engine control unit, misfiring is always indicated in pairs:

Ignition output 1 = Misfire in cylinders 1 and 4

Ignition output 2 = Misfire in cylinders 2 and 3

Fault code		Fault text	Fault elimination
SAE	V.A.G		
P0321	16705	Engine speed sender -G28 implausible signal	- Check engine speed sender =>Page 116
P0322	16706	Engine speed sender -G28 no signal	
P0327	16711	Knock sensor 1 -G61 signal too low	- Check knock sensor => Page 181
P0328	16712	Knock sensor 1 -G61 signal too high	- Loosen knock sensor and retighten to 20 Nm
P0335	16719	Engine speed sender -G28 faulty	- Check engine speed sender =>Page 116
P0341	16725	Camshaft pos. sensor=>Sensor -G40 implausible signal	- Check Hall sender =>Page 175
P0342	16726	Camshaft pos. -sensor=>Sensor -G40, signal too low	
P0343	16727	Camshaft pos. -sensor=>Sensor -G40, signal too high	
P0404	16788	Exhaust gas recirculation system, control difference	- Check exhaust gas recirculation valve=>Page 25 , Final control diagnosis

Fault code		Fault text	Fault elimination
SAE	V.A.G		
P0411	16795	Secondary air system, through-flow defective	- Check secondary air pump motor => Page 25 , Final control diagnosis
			- Check secondary air inlet valve => Page 25 , Final control diagnosis
			- Check combi valve: => Repair group 26; Secondary air system
			- Check hoses and connecting pipes to/between components: => Repair group 26; Secondary air system
P0420	16804	Bank 1 catalyst system, efficiency too low	- Check catalyst: => Repair group 26; Removing and installing parts of the exhaust system

5 - Final control diagnosis

5.1 - Final control diagnosis

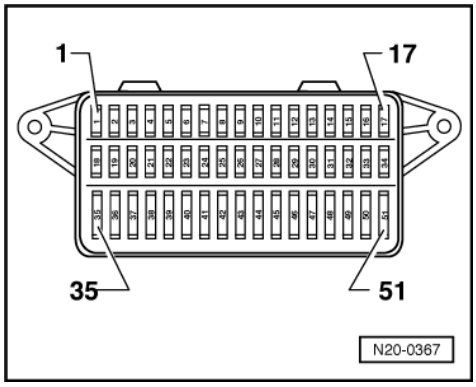
5.2 - Performing final control diagnosis

The final control diagnosis activates the following components in the stated sequence:

1. Fuel pump relay -J17
1. Solenoid valve 1 for activated charcoal filter -N80
3. Exhaust gas recirculation valve -N18
4. Intake manifold change-over valve -N156
5. Secondary air inlet valve -N112
6. Secondary air pump relay -J299

Special tools, workshop equipment, testers, measuring instruments and auxiliary items required

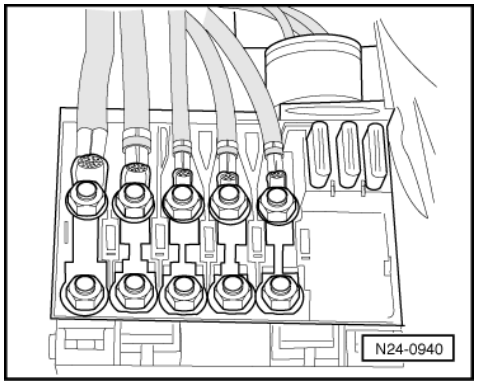
- Hand multimeter V.A.G 1526 or multimeter V.A.G 1715
- Diode test lamp V.A.G 1527
- Fault reader V.A.G 1551 (or vehicle system tester V.A.G 1552) with cable V.A.G 1551/3
- Adapter set V.A.G 1594
- Test box V.A.G 1598/31
- Current flow diagram



Protected by copyright. Copyright by Volkswagen AG.
Copyright by Volkswagen AG. Volkswagen AG does not guarantee or accept any liability with respect to the correctness of information in this document. Copying for private or commercial purposes, in part or in whole, is not permitted unless authorised by Volkswagen AG.
satelettronica

Check conditions

- -> The fuses 1, 31, 36 and 40 must be OK.



- -> The main fuses must be OK.
- The battery voltage must be at least 11.5 V.
- Earth connection in plenum chamber OK.
- All electrical consumers, e.g. lights and rear window heating must be switched off.
- If the vehicle is equipped with an air conditioning system, this must be switched off.

Notes:

- All functions of V.A.G 1551/1552 can also be carried out with the new tester VAS 5051. Connecting VAS 5051 => Page 6 .
- The final control diagnosis can only be carried out if the engine is stationary and ignition switched on.
- The final control diagnosis will be broken off if the engine is started or a rotational impulse is recognised.
- During the final control diagnosis, the individual final controls are activated 50 times (relay for secondary air pump -J299 10 seconds) unless the ⇒ key is pressed before hand to switch manually to the next final control.
- The final controls are checked acoustically or by touching.
- If it is necessary to repeat the final control diagnosis, without first running the engine briefly, switch the ignition off for approx. 2 seconds.
- The electric fuel pump will run during the complete final control diagnosis.

Work sequence

- Connect the fault reader V.A.G 1551 (V.A.G 1552). Then switch ignition on and select engine control unit with the "Address word" 01.
  (Connecting fault reader and selecting engine control unit => Page 4 .)

-> Indicated on display:

```
Rapid data transfer      HELP
Select function XX
```

- Operate fault reader taking into account the information on the display:
- Press keys 0 and 3 for the function "Final control diagnosis".

-> Indicated on display:

```
Rapid data transfer      Q
03 Final control diagnosis
```

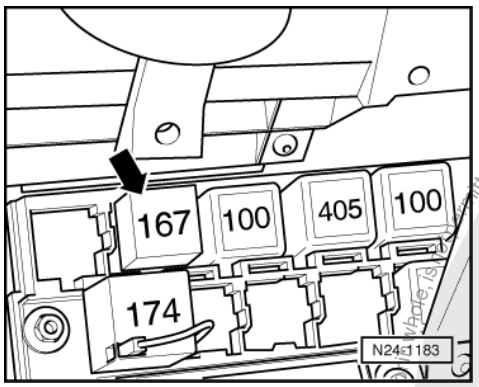
Activating fuel pump relay (J17):

- Confirm input with Q key.

-> Indicated on display:

```
Final control diagnosis
Fuel pump relay-J17
```

Protected by copyright. Copying for private or commercial purposes, in part or in whole, is not permitted unless authorised by Volkswagen AG. Volkswagen AG does not guarantee or accept any liability with respect to the correctness of information in this document. Copyright by Volkswagen AG.
satelettronica



-> The fuel pump relay (on relay plate, relay position 2) -arrow- must click until the next final control is activated by pressing the ⇒button (max. 50 times).

Note:

During the activation of the fuel pump relay the fuel pump must be heard to run at intervals.

If the relay does not click:

- Proceed with final control diagnosis until completed.
- Switch off ignition.
- Check fuel pump relay (J17):

=> Current flow diagrams, Electrical fault finding and Fitting locations

Notes:

- If tools are necessary to pull relays or control units out of the relay plate, first disconnect battery earth strap.
- Before disconnecting battery earth strap obtain code for radios with anti-theft coding.

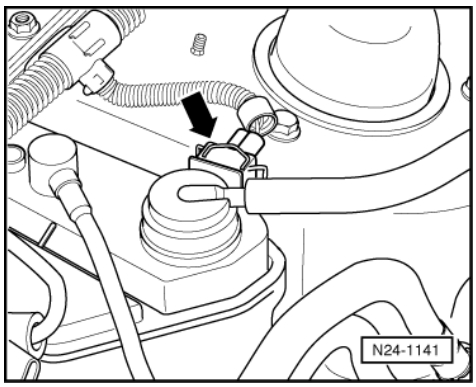
Activating activated charcoal filter solenoid valve 1 (N80):

- Press ⇒key.

-> Indicated on display:

```
Final control diagnosis
Activ. charcoal filter solenoid valve
1     -N80
```

The activated charcoal filter solenoid valve 1 must click (maximum 50 times) until you activate the next final control by pressing the ⇒key.



If the solenoid valve does not click:

- -> Pull 2-pin connector off solenoid valve 1 (N80) -arrow-.

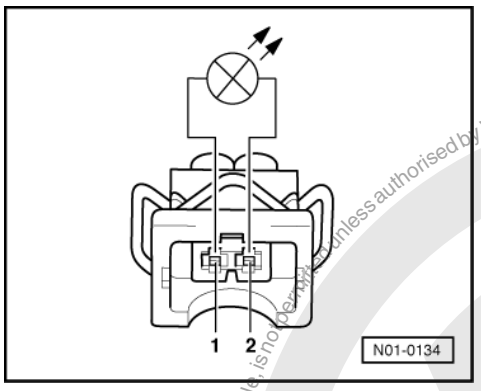
satelettronica



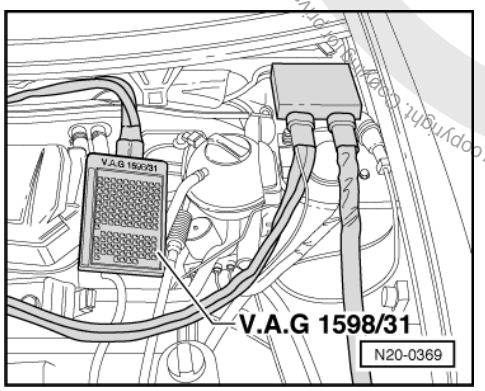
- -> Connect diode test lamp V.A.G 1527 using adapter cables from V.A.G 1594 to detached connector. The LED must flash

LED flashes:

- Proceed with final control diagnosis until completed.
- Switch off ignition.
- Replace solenoid valve 1 (N80):

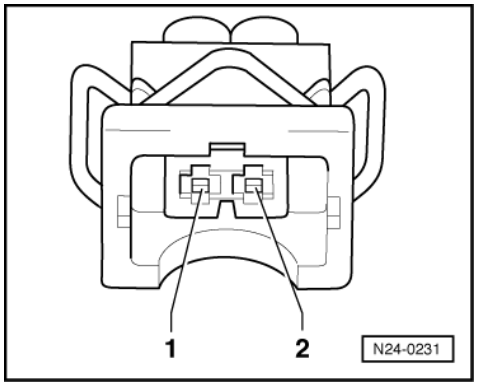
=> Repair group 20; Activated charcoal filter system; Servicing parts of activated charcoal filter system Activated charcoal filter system Servicing parts of activated charcoal filter system

- Interrogate fault memory, if necessary, repair any faults and then erase fault memory => Page 10 , interrogating and erasing fault memory.



LED does not flash:

- Proceed with final control diagnosis until completed.
- Switch off ignition.
- Remove left cover for plenum chamber.
- -> Connect test box V.A.G 1598/31 to control unit wiring harness. The engine control unit remains disconnected.



Protected by copyright. Copying for private or commercial purposes, in part or in whole, is not permitted unless authorised by Volkswagen AG. Volkswagen AG does not guarantee or accept any liability with respect to the correctness of information in this document. Copyright by Volkswagen AG.
satelettronica

- -> Check wire between test box and 2-pin connector for open circuit using current flow diagram:
  Contact 2 and test box socket 61
  Wire resistance: max. 1.5 ω
- Check wiring additionally for short to vehicle earth or battery positive.
  Specification: ∞ω
- Check wire between 2 pin connector contact 1 and fuel pump relay (J17) for open circuit using current flow diagram.
  Wire resistance: max. 1.5 ω

If no fault is detected in the wiring:

- Replace engine control unit
  => Page 145 .

Activate exhaust gas recirculation valve (N18):

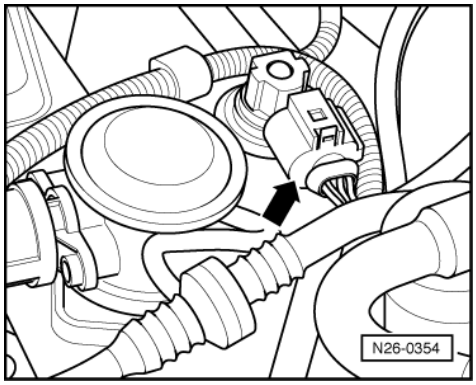
- Press ⇒key.

-> Indicated on display:

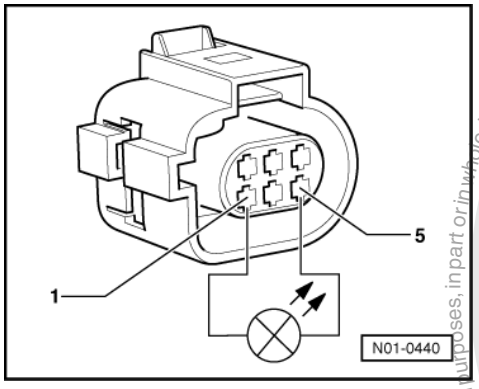
```
Final control diagnosis
Exhaust gas recirculation valve -N18
```

The exhaust gas recirculation valve must click (max. 50 times) until the ⇒ key is pressed to activate the next final control.

If the exhaust gas recirculation valve does not click:



- -> Pull 6-pin connector off exhaust gas recirculation valve (N18) -arrow-.



- -> Connect diode test lamp V.A.G 1527 using adapter cables from V.A.G 1594 to contacts 1 and 5 of connector.
  The LED must flash

LED flashes:

- Proceed with final control diagnosis until completed.
- Switch off ignition.

satelettronica
Protected by copyright. Copying for private or commercial purposes, in part or in whole, is not permitted unless authorised by Volkswagen AG. Volkswagen AG does not guarantee or accept any liability with respect to the correctness of information in this document. Copyright by Volkswagen AG.

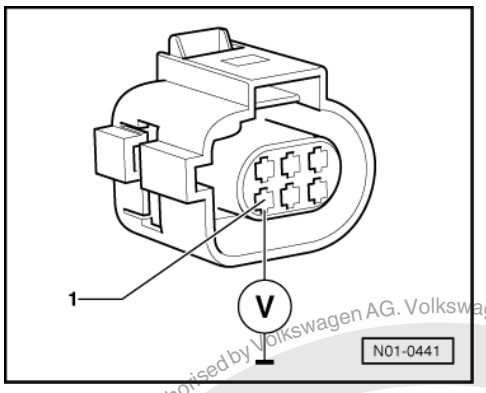
- Renew exhaust gas recirculation valve (N18):

=> Repair group 26; Exhaust gas recirculation system; Servicing parts of the exhaust gas recirculation system Exhaust gas recirculation system Servicing parts of the exhaust gas recirculation system

- Interrogate fault memory, if necessary, repair any faults and then erase fault memory => Page 10 , interrogating and erasing fault memory.
- Erase the learnt values and adapt the engine control unit again=> Page 147 .

LED does not flash:

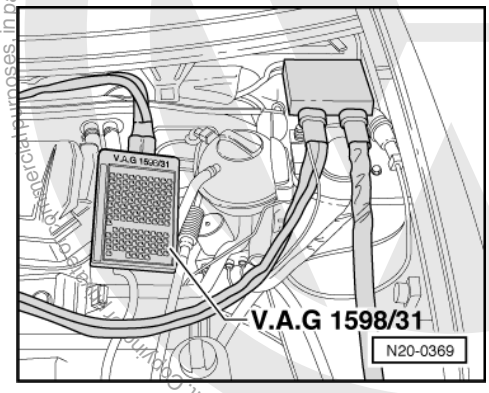
- Proceed with final control diagnosis until completed.
- Switch off ignition.



- -> Connect multimeter to measure voltage using aux. cables from V.A.G 1594 to contacts 1 (positive) and earth of connector.
- Switch on ignition.
  Specification: min. 11.5 V
- Switch off ignition.

If the specification is not attained:

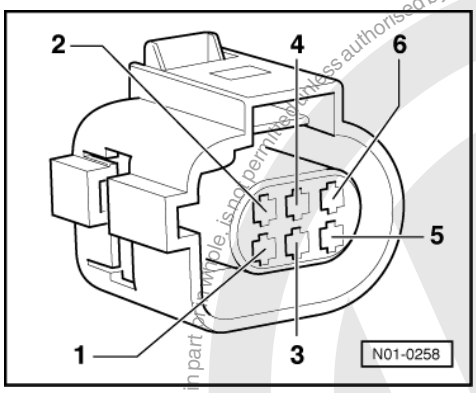
- Check wire between 6-pin connector contact 1 and voltage supply relay for Simos control unit (J363), on relay plate relay position 4, for open circuit using current flow diagram.
  Wire resistance: max. 1.5 ω



If the specification is obtained:

- Remove left cover for plenum chamber.
- -> Connect test box V.A.G 1598/31 to control unit wiring harness. The engine control unit remains disconnected.

satelettronica



- -> Check wire between test box and 6-pin connector for open circuit using current flow diagram:
  Contact 5 and test box socket 115
  Wire resistant: max. 1.5 ω
- Check wiring additionally for short to vehicle earth or battery positive.
  Specification: ∞ω

If no wiring fault is detected:

- Replace engine control unit
  => Page 145 .

Activating intake manifold change-over valve (N156):

- Press ⇒key.

-> Indicated on display:

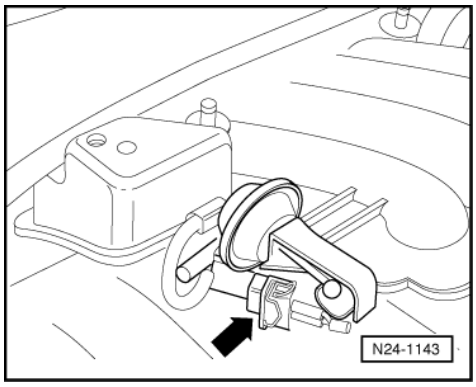
```
Final control diagnosis
Intake manifold change-over valve -N156
```

The variable intake manifold change-over valve must click (max. 50 times) until the next final control is activated by pressing the ⇒key.

Note:

Checking intake manifold change-over => Page 141 .

If the solenoid valve does not click:



- -> Pull 2-pin connector off variable intake manifold change-over valve (N156) -arrow-.

Volkswagen AG. Volkswagen AG does not guarantee or accept any liability with respect to the correctness of information in this document. Copyright by Volkswagen AG. Protected by copyright. satelettronica

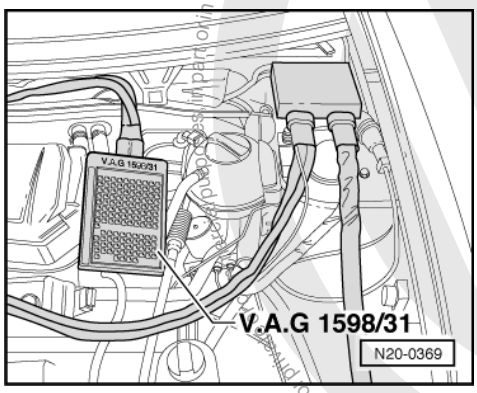
- -> Connect diode test lamp V.A.G 1527 using adapter cables from V.A.G 1594 to detached connector. The LED must flash

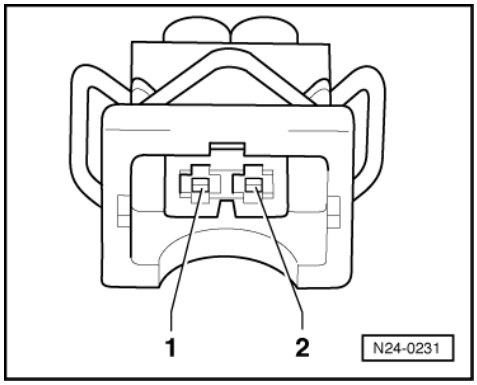
LED flashes:

- Proceed with final control diagnosis until completed.
- Switch off ignition.
- Renew intake manifold change-over valve (N156) Page 87 , item 12 .
- Interrogate fault memory, if necessary, repair any faults and then erase fault memory => Page 10 , interrogating and erasing fault memory.



LED does not flash:

- Proceed with final control diagnosis until completed.
- Switch off ignition.
- Remove left cover for plenum chamber.
- -> Connect test box V.A.G 1598/31 to control unit wiring harness. The engine control unit remains disconnected.



- -> Check wire between test box and 2-pin connector for open circuit using current flow diagram:
  Contact 2 and test box socket 117
  Wire resistance: max. 1.5 ω
- Check wiring additionally for short to vehicle earth or battery positive.

satelettronica

Specification: ∞ω
- Check wire between 2 pin connector contact 1 and fuel pump relay (J17) for open circuit using current flow diagram.
  Wire resistance: max. 1.5 ω

If no wiring fault is detected:

- Replace engine control unit
  => Page 145 .

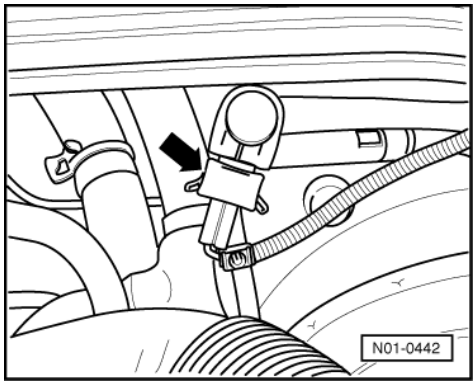
Activating secondary air inlet valve (N112):

- Press ⇒key.

-> Indicated on display:

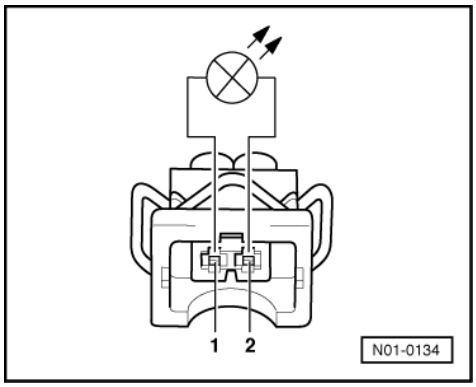
```
Final control diagnosis
Secondary air inlet valve -N112
```

The secondary air inlet valve must click (max. 50 times) until the next final control is activated by pressing the ⇒ key.



If the valve does not click:

- -> Pull 2-pin connector off secondary air intake valve (N112) -arrow-.



- -> Connect diode test lamp V.A.G 1527 using adapter cables from V.A.G 1594 to detached connector.
  The LED must flash

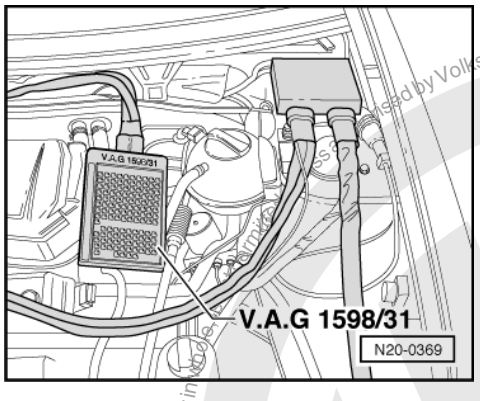
LED flashes:

- Proceed with final control diagnosis until completed.
- Switch off ignition.
- Replace secondary air inlet valve (N112):

Protected by copyright. Copying for private or commercial purposes, in part or in whole, is not permitted unless authorised by Volkswagen AG. Volkswagen AG does not guarantee or accept any liability with respect to the correctness of information in this document. Copyright by Volkswagen AG.
satelettronica

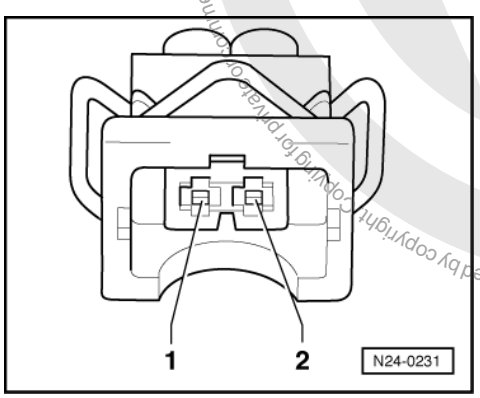
=> Repair group 26; Secondary air system; Removing and installing parts of the secondary air system Secondary air system Removing and installing parts of the secondary air system

- Interrogate fault memory, if necessary, repair any faults and then erase fault memory => Page 10 , interrogating and erasing fault memory.



LED does not flash:

- Proceed with final control diagnosis until completed.
- Switch off ignition.
- Remove left cover for plenum chamber.
- -> Connect test box V.A.G 1598/31 to control unit wiring harness. The engine control unit remains disconnected.



- -> Check wiring between test box and 2-pin connector for open circuit using current flow diagram:
  Contact 2 and test box socket 71
  Wire resistance: max. 1.5 ω
- Check wiring additionally for short to vehicle earth or battery positive.
  Specification: ∞ω

- Check wire between 2 pin connector contact 1 and fuel pump relay (J17) for open circuit using current flow diagram.
  Wire resistance: max. 1.5 ω

If no wiring fault is detected:

- Replace engine control unit
  => Page 145 .

Activating secondary air pump relay (J299):

Note:

The secondary air pump relay (J299) is only activated for approx. 10 seconds. Therefore, it is possible that the final control diagnosis will have to be initiated several times during the test.

Protected by copyright. Copying for private or commercial purposes, in part or in whole, is not permitted unless authorised by Volkswagen AG. Volkswagen AG does not guarantee or accept any liability with respect to the correctness of information in this document. Copyright by Volkswagen AG.
satelettronica

- Press ⇒key.

-> Indicated on display:

```
Final control diagnosis
Secondary air pump relay -J299
```

The secondary air pump relay (on relay plate, relay position 3) is activated for approx. 10 seconds.
The secondary air pump motor (V101) is activated from the secondary air pump relay and runs (approx. 10 seconds) until the final control diagnosis is ended by pressing the ⇒key.

If the secondary air pump motor runs:
- Press ⇒key.

-> Indicated on display:

```
Final control diagnosis
END
```

-> Indicated on display:

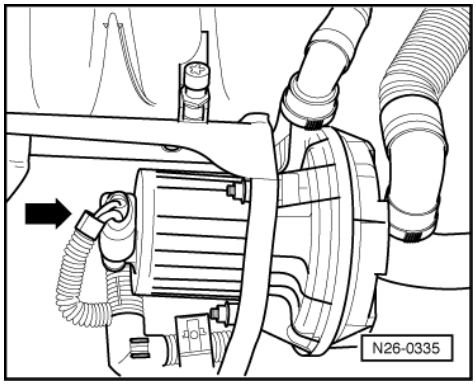
```
Function not known or cannot
be carried out at the moment
```

- Press ⇒key.

-> Indicated on display:

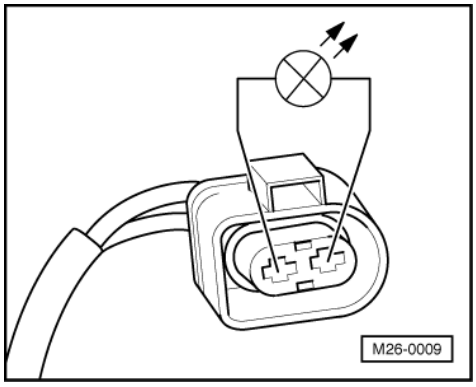
```
Rapid data transfer      HELP
Select function XXX
```

Note:
Is displayed as 7th component of the final control diagnosis:
WARNING Fan is switched on
Ignore this display. Continue final control diagnosis by pressing ⇒key, as the radiator fan is only activated on vehicles with map-controlled engine cooling.



- Press keys 0 and 6 for the "End output" function and confirm input with the Q key.
- Switch off ignition.

If the secondary air pump motor does not run:
- -> Pull off 2-pin secondary air pump motor connector (V101) -arrow-.



Protected by copyright. Copying for private or commercial purposes, in part or in whole, is not permitted unless authorised by Volkswagen AG. Volkswagen AG does not guarantee or accept any liability with respect to the correctness of information in this document. Copyright by Volkswagen AG.
satelettronica

- -> Connect diode test lamp V.A.G 1527 using adapter cables from V.A.G 1594 to detached connector.
- Initiate final control diagnosis again and activate secondary air pump relay (J299).
  LED must light for approx. 10 seconds.

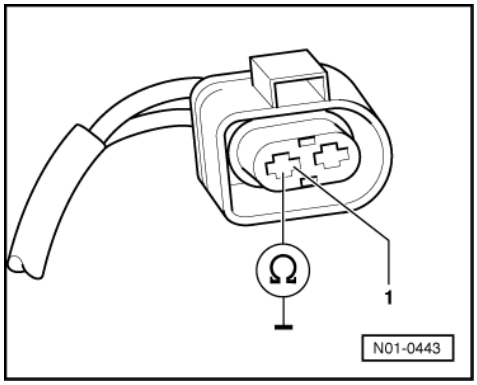
If LED does not light:

- Proceed with final control diagnosis until completed.
- Switch off ignition.
- Renew secondary air pump motor (V101):

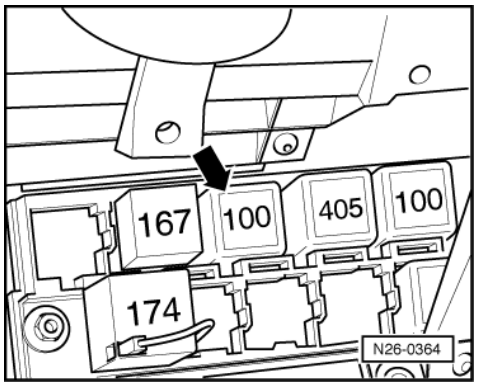
=> Repair group 26; Secondary air system; Removing and installing parts of secondary air system Secondary air system Removing and installing parts of secondary air system

- Interrogate fault memory, if necessary, repair any faults and then erase fault memory => Page 10 , interrogating and erasing fault memory.

If the LED does not flash but the secondary air pump relay clicks:



- Proceed with final control diagnosis until completed.
- Switch off ignition.
- Check wire between 2-pin connector contact 1 and body earth for open circuit using current flow diagram.
  Wire resistance: max. 1.5 ω



If no wiring fault is detected:

- -> Pull secondary air pump relay (on relay plate, relay position 3) -arrow- off relay carrier.

Notes:

- If tools are necessary to pull relays or control units out of the relay plate, first disconnect battery earth strap.
- Before disconnecting battery earth strap obtain code for radios with anti-theft coding.

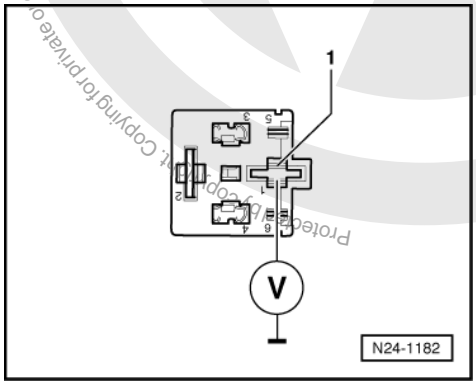
- -> Check wire for open circuit between 2-pin connector contact 2 and contact 2 on relay plate.
  Wire resistance: max. 1.5 ω

If no wiring fault is detected:



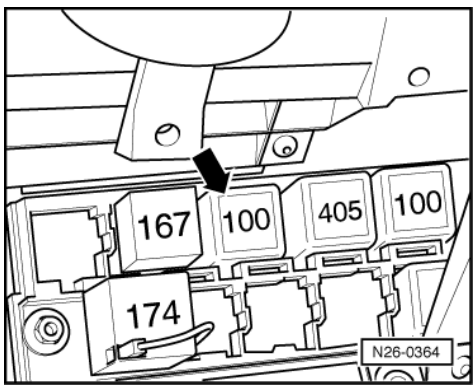
- -> Check the voltage supply on contact 1 (terminal 30) and body earth for secondary air pump relay.
  Specification: at least 11.5 V

If voltage supply is OK:

- Replace the secondary air pump relay (J299).
- Interrogate fault memory, if necessary, repair any faults and then erase fault memory => Page 10 , interrogating and erasing fault memory.

If the LED does not light and the secondary air pump relay does not click:

- Proceed with final control diagnosis until completed.



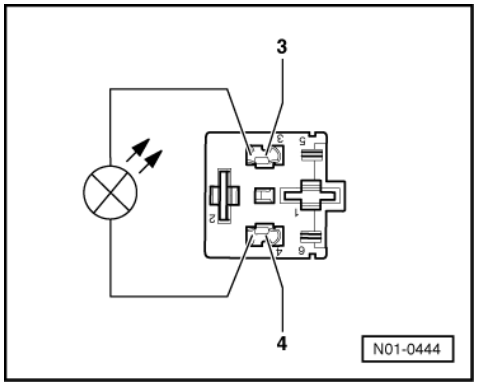
- Switch off ignition.
- -> Pull secondary air pump relay (on relay plate, relay position 3) -arrow- off relay carrier.

Notes:

- If tools are necessary to pull relays or control units out of the relay plate, first disconnect battery earth strap.

satelettronica

- Before disconnecting battery earth strap obtain code for radios with anti-theft coding.



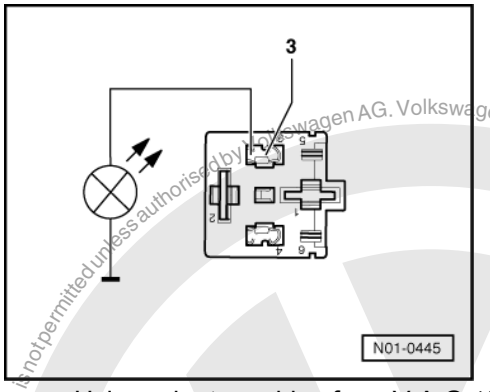
- -> Using adapter cables from V.A.G 1594, connect diode test lamp V.A.G 1527 to contacts 3 and 4 on the relay plate.
- Initiate final control diagnosis again and activate secondary air pump relay (J299).
  LED must light for approx. 10 seconds.

If LED lights:

- Proceed with final control diagnosis until completed.
- Switch off ignition.
- Replace the secondary air pump relay (J299).
- Interrogate fault memory, if necessary, repair any faults and then erase fault memory => Page 10 , interrogating and erasing fault memory.

If LED does not light:

- Proceed with final control diagnosis until completed.
- Switch off ignition.



- -> Using adapter cables from V.A.G 1594, connect the diode test lamp V.A.G 1527 to contact 3 of relay plate and body earth.
- Initiate final control diagnosis again and activate secondary air pump relay (J299).
  LED must light for approx. 10 seconds.

If LED does not light:

- Proceed with final control diagnosis until completed.
- Switch off ignition.

Check wire between contact 3 of relay plate and fuel pump relay (J17) for open circuit using current flow diagram.
Wire resistance: max. 1.5 ω

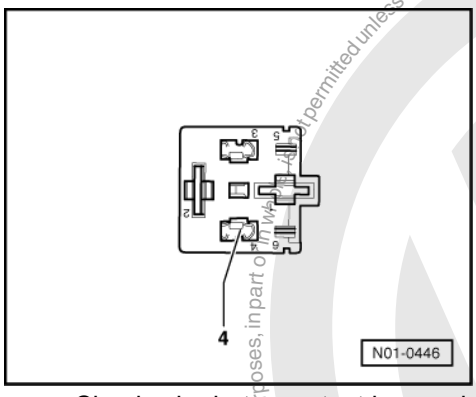
- Switch off ignition.
- Remove left cover for plenum chamber.
- -> Connect test box V.A.G 1598/31 to control unit wiring harness. The engine control unit remains disconnected.



- -> Check wire between test box and relay plate for open circuit using current flow diagram:
  Contact 4 and test box socket 72
  Wire resistance: max. 1.5 ω

If no wiring fault is detected:

- Replace engine control unit
  => Page 145 .

6 - Readiness code

6.1 - Readiness code

Engine code AUR only

Function

The readiness code is an 8-digit number code which displays the status of the emission relevant diagnosis.

When the diagnosis for a system (e.g. secondary air system) has been successfully completed, the corresponding position in the number code will change from 1 to 0.

Protected by copyright. Copyright for printed or electronic copies, in part or in whole, is not permitted unless authorised by Volkswagen AG. Volkswagen AG does not guarantee or accept any liability with respect to the correctness of information in this document. Copyright by Volkswagen AG.
satelettronica

The diagnosis is performed at regular intervals during normal driving. It is recommended that the readiness code be generated after performing repairs on an emission relevant system, to guarantee that these systems function correctly. If a fault is detected during the diagnosis it will be entered in the fault memory.

Each time the fault memory is erased the readiness code will be erased.

6.2 - Reading readiness code

Special tools, workshop equipment, testers, measuring instruments and auxiliary items required

- Fault reader V.A.G 1551 (or vehicle system tester V.A.G 1552) with cable V.A.G 1551/3

Work sequence

- Connect the fault reader V.A.G 1551 (V.A.G 1552). Then switch ignition on and select engine control unit with the "Address word" 01.
  (Connecting fault reader and selecting engine control unit => Page 4 .)

-> Indicated on display:

```
Rapid data transfer      HELP
Select function XXX
```

- Press keys 1 and 5 for the "Readiness code" function and confirm entry with Q key.

Must appear on display when all diagnosis functions have been successfully completed:

-> Indicated on display:

```
Readiness code
00000000 - Test complete
```

- Press ⇒key.
- Press keys 0 and 6 for the "End output" function and confirm input with the Q key.
- Switch off ignition.

-> Indicated on display:

```
Readiness code
00101101 - Test not complete
```

One of the diagnostic checks has not run through successfully:

- Press ⇒key.
- Generate readiness code => Page 41 .

Significance of 8 digit number block for readiness code

Only when all displays = 0, is the readiness code generated								
1	2	3	4	5	6	7	8	Diagnostic function
							0	Catalyst
						0		Catalyst heating (currently no diagnosis/always "0")
					0			Activated charcoal filter system (tank venting system)
				0				Secondary air system
			0					Air conditioner (currently no diagnosis/always "0")
		0						Lambda probes
	0							Lambda probe heating
0								Exhaust gas recirculation

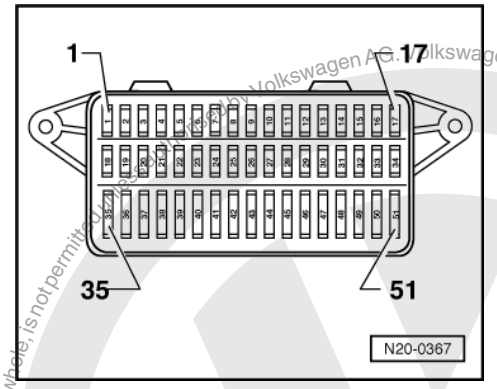
satelettronica

6.3 - Generating readiness code

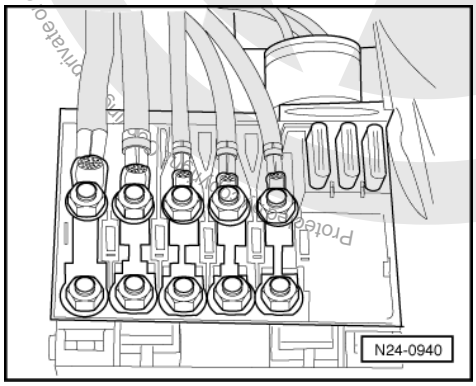


Special tools, workshop equipment, testers, measuring instruments and auxiliary items required

- Fault reader V.A.G 1551 (or vehicle system tester V.A.G 1552) with cable V.A.G 1551/3

Test conditions

- -> All fuses must be OK.
- Vehicle stationary
- The battery voltage must be at least 11.5 V.



- -> The main fuses must be OK.
- The signals from brake light switch and brake pedal switch must be OK, checking => Page 160 .
- Coolant temperature must be at least 80 °C, =>display group 100, display zone 2.
- Intake air temperature less than 60°C =>display group 04, display zone 4

Work sequence

- Connect fault reader V.A.G 1551 (V.A.G 1552). Start engine and select "Address word" 01 of engine control unit. When doing this the engine must be running at idling speed. (Connecting fault reader and selecting engine control unit => Page 4 .)

Work step 1: Interrogate fault memory

-> Indicated on display:

```
Rapid data transfer      HELP
Select function XXX
```

- Press keys 0 and 2 for function "Interrogate fault memory" and confirm entry with Q key.

-> The number of faults stored or "No fault recognised!" will be shown on the display.

Copyright by Volkswagen AG. Volkswagen AG does not guarantee or accept any liability with respect to the correctness of information in this document. Copyright by Volkswagen AG. Protected by copyright. Copying for private or commercial purposes, in part or in whole, is not permitted unless authorised by Volkswagen AG.
satelettronica

```
X Faults recognised!
```

If a fault is stored:

- Rectify faults printed out using fault table:
  SAE P0 or P2 codes=> Page 16

If no fault is stored:

- Press ⇒key.

Work step 2: Erase fault memory

-> Indicated on display:

```
Rapid data transfer      HELP
Select function XXX
```

- Press keys 0 and 5 for the function "Erase fault memory" and confirm entry with Q key.

Note:

The readiness code is reset or erased each time fault memory is erased.

-> Indicated on display:

```
Rapid data transfer
Fault memory is erased!
```

Note:

If the ignition is switched off between "Interrogate fault memory" and "Erase fault memory" the fault memory will not be erased.

- Press ⇒key.

Work step 3: Matching the throttle valve control part to the engine control unit

-> Indicated on display:

```
Rapid data transfer      HELP
Select function XXX
```

- Press keys 0 and 8 for the function "Read measured value block" and confirm entry with Q key.

-> Indicated on display:

```
Read measured value block
Input display group number XXX
```

- Press keys 0, 6 and 0 for the "Display group number 60" and confirm entry with Q key.
- Check adaption state of throttle valve control part in display zone 4
  Specification: ADP. OK.

-> Indicated on display:
(1...4 = display zones)

```
Read measured value block      60
     xx.x %     xx.x %     x     ADP. OK
```

If the display does not indicate as described:

- Erase the learnt values and adapt the engine control unit again=> Page 147 .

If the display indicates as described:

- Press C key.

satelettronica

Work step 4: Basic setting for exhaust gas recirculation valve (N18)

-> Indicated on display:

```
Read measured value block
Input display group number XXX
```

- Press keys 0, 7 and 4 for "display group number 74" and confirm entry with Q key.
- Check adaption state of exhaust gas recirculation valve in display zone 4
  Specification: ADP. OK.

-> Indicated on display:
(1...4 = display zones)

```
Read measured value block     74
     xx.x V     xx.x V     xx.x %     ADP.
OK
```

If the display does not indicate as described:

- Erase the learnt values and adapt the engine control unit again=> Page 147 .

If the display indicates as described:

- Press C key.

Work step 5: Check of minimum running period since start of engine and coolant temperature

-> Indicated on display:

```
Read measured value block
Input display group number XXX
```

- Press keys 1, 0 and 0 for the "Display group number 100" and confirm entry with Q key.

Note:

During further work sequence the engine must not be switched off again. To maintain a more constant engine speed switch on lights or rear window heating if necessary.

-> Indicated on display:
(1...4 = Display zones)

```
Read measured value block 100
     1     2     3     4
```

- Check coolant temperature (display zone 2)
  Specification: min. 80 °C
  and the minimum running period since start of engine (display zone 3)
  Specification: min. 120 seconds

If the specifications are obtained:

- Press ⇒key.

Work step 6: Lambda probe readiness

-> Indicated on display:

```
Rapid data transfer     HELP
Select function XXX
```

- Press keys 0 and 4 for the function "Initiating basic settings" and confirm entry with Q key.

-> Indicated on display:

```
Basic setting
Input display group number XXX
```

satelettronica

- Press keys 0, 3 and 0 for the "Display group number 30" and confirm entry with Q key.

-> Indicated on display:
(1...2 = Display zones)

```
System in basic setting 30
     1      2
```

- Check Lambda control status before catalyst (display zone 1):
  Specification: 1 1 1
  (Significance => Page 59)
- Increase engine speed to 2500...4000 rpm until the Lambda probe after catalyst is ready for use (display zone 2):
  Specification: 1 1 x
  (Significance => Page 59)

Notes:

- The first position of the 3 digit number block fluctuates between 0 and 1 (Lambda probe heating on and off).
- The rightmost position of the 3 digit number block (display zone 2) will be set to 1 only at part load and increased exhaust temperature.

If the specifications are not obtained:

- Interrogate fault memory => Page 10 .

If the specifications are obtained:

- Press C key.

-> Indicated on display:

```
Basic setting
Input display group number XXX
```

- Press keys 2, 2 and 7 for the "Display group number 227" and confirm entry with Q key.

-> Indicated on display:
(1...4 = Display zones)

```
System in basic setting 227
     1      2      3    4
```

- Increase and maintain engine speed between 2500...4000 rpm.
- Observe the third display zone. The counter must count up to 100 four times.
- Then run engine at idling speed.
- Press C key.

Work step 7: Lambda probe ageing before catalyst diagnosis

-> Indicated on display:

```
Basic setting
Input display group number XXX
```

- Press keys 0, 3 and 4 for "Display group number 34" and confirm entry with Q key.

-> Indicated on display:
(1...4 = Display zones)

```
System in basic setting     34
     1      2      3     4
```

- Raise engine speed to 2500...4000 rpm until display in display zone 4 jumps from "Test OFF" to "Test ON".

Protected by copyright. Copying for private or commercial purposes, in any form whatsoever, is not permitted unless authorised by Volkswagen AG. Volkswagen AG does not guarantee or accept any liability with respect to the correctness of information in this document. Copyright by Volkswagen AG.

satelettronica

Note:

This process can take a few minutes. Depending upon the control unit version, the test starts between 100...400 °C catalyst temperature (display zone 2).

- Maintain the increased engine speed until the display in display zone 4 shows the result of the brief test: Specification "B1-P1 OK"

If the display does not indicate as described:

- Interrogate fault memory, if necessary, repair any faults and then erase fault memory => Page 10 , interrogating and erasing fault memory.

If the display indicates as described:

- Press C key.

Work step 8: Activated charcoal filter system diagnosis (tank breathing system)

- Press keys 0, 7 and 0 for "Display group number 70" and confirm entry with Q key.

-> Indicated on display:
(1...4 = Display zones)

```
System in basic setting      70
     1      2      3      4
```

When the diagnosis is initiated by the engine control unit the display in display zone 4 jumps from "Test OFF" to "Test ON"

- Run engine at idling speed until the display in display zone 4 shows the result of the short test. Specification "TBV OK"

If the display does not indicate as described:

- Interrogate fault memory, if necessary, repair any faults and then erase fault memory => Page 10 , interrogating and erasing fault memory.

If the display indicates as described:

- Press C key.

Work step 9: Exhaust gas recirculation system diagnosis

-> Indicated on display:

```
Basic setting
Input display group number XXX
```

- Press keys 0, 7 and 5 for the "Display group number 75" and confirm entry with Q key.

-> Indicated on display:
(1...4 = Display zones)

```
System in basic setting      75
     1      2      3      4
```

If the diagnosis is initiated from engine control unit the display in display zone 4 jumps from "Test OFF" to "Test ON"

- Run engine at idling speed until the display in display zone 4 shows the result of the short test. Specification "Syst. OK."

If the display does not indicate as described:

satelettronica

- Interrogate fault memory, if necessary, repair any faults and then erase fault memory => Page 10 , interrogating and erasing fault memory.

If the display indicates as described:

- Press C key.

Work step 10: Secondary air system diagnosis

-> Indicated on display:

```
Basic setting
Input display group number XXX
```

- Press keys 0, 7 and 7 for the "Display group number 77" and confirm entry with Q key.

-> Indicated on display:
(1...4 = Display zones)

```
System in basic setting     77
     1     2     3     4
```

- Depress brake pedal and hold it down.

  The engine speed is increased by the control unit to approx. 1400 rpm.

If the diagnosis is initiated from engine control unit the display in display zone 4 jumps from "Test OFF" to "Test ON"

- Maintain the increased engine speed until the display in display zone 4 shows the result of the short test. Specification: "Syst. OK."

If the display does not indicate as described:

- Interrogate fault memory, if necessary, repair any faults and then erase fault memory => Page 10 , interrogating and erasing fault memory.

If the display indicates as described:

- Press C key.

Work step 11: Diagnosis of Lambda probe after catalyst

-> Indicated on display:

```
Basic setting
Input display group number XXX
```

- Press keys 0, 4 and 3 for "Display group number 43" and confirm entry with Q key.

-> Indicated on display:
(1...4 = Display zones)

```
System in basic setting     43
     1     2     3     4
```

- Depress brake pedal and hold it down.

  The engine speed is increased by the control unit to about 1400 rpm.

When the diagnosis is initiated by the engine control unit the display in display zone 4 jumps from "Test OFF" to "Test ON"

satelettronica

Note:

This process can take a few minutes.

- Maintain the increased engine speed until the display in display zone 4 shows the result of the short test Specification "B1-P2 OK."

If the display does not indicate as described:

- Interrogate fault memory, if necessary, repair any faults and then erase fault memory => Page 10 , interrogating and erasing fault memory.

If the display indicates as described:

- Press C key.

Work step 12: Catalyst diagnosis

-> Indicated on display:

```
Basic setting
Input display group number XXX
```

- Press keys 0, 4 and 6 for "Display group number 46" and confirm entry with Q key.

-> Indicated on display:
(1...4 = Display zones)

```
System in basic setting     46
     1     2     3     4
```

- Raise engine speed to 2500...4500 rpm until display in display zone 4 jumps from "Test OFF" to "Test ON". Catalyst temperature in display zone 2 must be at least 400 °C.
- Continue to maintain engine speed at 2500...4500 rpm until Specification "Cat B1 OK" appears in display zone 4.

If the display does not indicate as described:

- Interrogate fault memory, if necessary, repair any faults and then erase fault memory => Page 10 , interrogating and erasing fault memory.

If the display indicates as described:

- Press ⇒key.
- Read readiness code=> Page 40

7 - Measured value blocks

7.1 - Measured value blocks

7.2 - Safety precautions

Observe following if test and measuring instruments are required during a test drive:

- Test and measuring instruments must be secured to rear seat and operated by a 2nd person from this location.

  If test and measuring instruments are operated from front passenger's seat and the vehicle is involved in an accident, there is a possibility that the person sitting in this seat may receive serious injuries when the airbag is triggered.

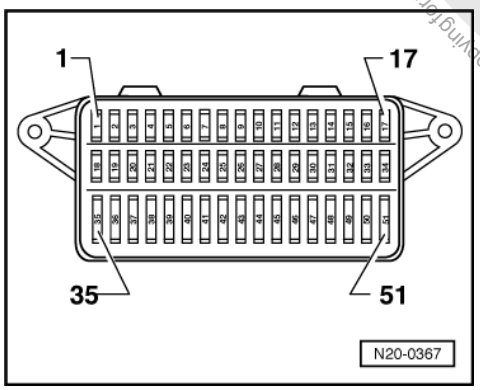
7.3 - Read measured value block

The measured values in the functions read measured value block and basic setting are described during the individual component test. This table serves only as an overview.

Special tools, workshop equipment, testers, measuring instruments and auxiliary items required

- Fault reader V.A.G 1551 (or vehicle system tester V.A.G 1552) with cable V.A.G 1551/3

Test conditions



- -> The fuses 1, 3, 24, 27, 31, 34, 36 and 40 must be OK.
- Earth connection in plenum chamber OK.
- All electrical consumers, e.g. lights and rear window heating must be switched off.
- If the vehicle is equipped with an air conditioning system, this must be switched off.
- No faults must be stored in fault memory => Page 10 , interrogating and erasing fault memory.
- Coolant temperature must be at least 80 °C, =>Display group 01, display zone 2.

Work sequence

- Connect fault reader V.A.G 1551 (V.A.G 1552). Start engine and select "Address word" 01 of engine control unit. When doing this the engine must be running at idling speed.
  (Connecting fault reader and selecting engine control unit => Page 4 .)

-> Indicated on display:

```
Rapid data transfer      HELP
Select function XXX
```

satelettronica

- Press keys 0 and 8 for the function "Read measured value block" and confirm entry with Q key.

-> Indicated on display:

```
Read measured value block
Input display group number XXX
```

- Select required display group number.

Note:

The display group number 1 is an example, to illustrate the sequence.

- Press keys 0, 0 and 1 for "Display group number 1" and confirm entry with Q key.

-> Indicated on display:
(1...4 = Display zones)

```
Read measured value block 1
     1     2     3     4
```

- Check whether the coolant temperature is above 80 °C in display zone 2.

Note:

To change to another display group proceed as follows:

Display group	V.A.G 1551	V.A.G 1552
Higher	Press key 3	Press ↑key
Lower	Press key 1	Press ↓key
Skip	Press key C	Press key C

- If the specifications in all display zones are obtained, press ⇒key.

-> Indicated on display:

```
Rapid data transfer      HELP
Select function XXX
```

- Press keys 0 and 6 for the "End output" function and confirm input with the Q key.
- Switch off ignition.

Note:

Measured value blocks which are not described in this chapter are currently only intended for the research and development and production. The values displayed are not relevant for service department fault finding.

8 - Evaluating measured value blocks, display groups 0...9 -Basic functions-

8.1 - Evaluating measured value blocks, display groups 0...9 -Basic functions-

Display group 1 -Basic functions-						
▪ Engine running at idling speed						
Read measured value block 1 ⇒				◂ Indicated on display		
xxxx rpm	xxx.x °C	xx.x %	xxxxxxxx			
1	2	3	4	◂ Display zones	Specification	Evaluation
				Adjustment conditions for basic setting	1x111111	=> Page 50

satelettronica

Engine speed (idling speed)	760...880 rpm	=> Page 50

1) Up-to-date specifications:

=> Exhaust emissions test binder

Evaluating display group 2, display zone 3 - Injection period

Appears on display	Possible fault cause	Fault elimination
Less than specification	- Large amount of fuel from activated charcoal filter system	- Check activated charcoal filter solenoid valve 1 => Page 25 , Final control diagnosis
More than specification	- Increased engine load due to electrical consumers, air conditioning or power assisted steering on full lock	- Eliminate increased load (air conditioning, power assisted steering etc.)

Evaluating display group 2, display zone 4 - Air mass drawn in

Appears on display	Possible fault cause	Fault elimination
Less than specification	- Large amount of unmetered air between intake manifold and air mass meter	- Check air intake system for leaks => Page 128
More than specification	- Increased engine load due to electrical consumers, air conditioning or power assisted steering on full lock	- Eliminate increased load (air conditioning, power assisted steering etc.)

Display group 3 -Basic functions-

▪ Engine running at idling speed

Read measured value block 3 ⇒ ◂ Indicated on display

xxxx rpm	x.x g/s	xxx.x %	xx.x°BTDC	◂ Display zones	Specification	Evaluation
1	2	3	4	Ignition timing	0.0...12° BTDC	---
				Throttle valve angle Angle sender 1 for throttle valve drive (G187)	0.0...4.0 %	=> Page 55
				Air mass drawn in	2.0...4.5 g/s	=> Page 51
				Engine speed (idling speed)	760...880 rpm	=> Page 50

1) Up-to-date specifications:

=> Exhaust emissions test binder

Note on display zone 3:

Display value must be approx. 100.0 % when accelerator pedal is fully depressed.

Display group 4 -Basic functions-

▪ Engine running at idling speed

Read measured value block 4 ⇒ ◂ Indicated on display

xxxx rpm	xx.x V	xxx.x °C	xxx.x °C	◂ Display zones	Specification	Evaluation
1	2	3	4	Intake air temperature	-38.0...80.0 °C	=> Page 53
				Coolant temperature	80.0...110.0 °C	=> Page 52

satelettronica

	Supply voltage for engine control unit	11.5...15.0 V	=> Page 52
	Engine speed (idling speed)	760...880 rpm	=> Page 50

1) Up-to-date specifications:

=> Exhaust emissions test binder

Note on display zone 3:

The engine control unit will use the intake air temperature as a replacement value for an engine start (start temperature - replacement value) as soon as there is a fault stored in the fault memory, which affects the coolant temperature sender (G62). The temperature then rises according to a model stored in the control unit. When the engine has reached normal working temperature a fixed replacement value will be displayed after a certain period. This fixed value is also dependent upon the intake air temperature (below or above 20 °C).

Note on display zone 4:

The total temperature range is given as the specification. The displayed value must be above ambient temperature.

Evaluating display group 4, display zone 2 - Control unit voltage supply

Appears on display	Possible fault cause	Fault elimination
Less than specification	- Alternator defective, battery heavily discharged	- Check alternator and battery voltage, charge battery: => Electrical system; Repair group 27
	- Battery heavily loaded shortly after starting due to high charging current and current consumers	- Increase revs slightly for a few minutes and switch off current consumers
	- Transfer resistance in the current supply or the engine control unit earth connection	- Check engine control unit voltage supply => Page 143
	- Current draw when ignition is off	- Eliminate current draw
More than specification	- Voltage regulator on alternator defective	- Check voltage regulator, renew if necessary: => Electrical system; Repair group 27
	- Excess voltage due to jump starting or quick charging unit	- Interrogate fault memory => Page 10 , Interrogating and erasing fault memory

Evaluating display group 4, display zone 3 - Coolant temperature

Appears on display	Possible fault cause	Fault elimination
Less than specification	- Engine too cold	- If necessary carry out test drive
	- Coolant temperature sender or wiring to engine control unit	- Check coolant temperature sender =>Page 113
More than specification	- Radiator soiled	- Clean radiator
	- Radiator fan not functioning	- Check function => Current flow diagrams, Electrical fault finding and Fitting locations
	- Thermostat sticking/defective	- Check thermostat: => Repair group 19; Removing and installing parts of cooling system; Parts of cooling system, engine side Parts of cooling system, engine side
	- Coolant temperature sender or wiring to engine control unit	- Check coolant temperature sender =>Page 113

9 - Evaluating measured value blocks, display groups 10...29 -Ignition-

9.1 - Evaluating measured value blocks, display groups 10...29 -Ignition-

Display group 10 -Ignition-						
▪ Engine running at idling speed						
Read measured value block 10 ⇒				◂ Indicated on display		
xxxx rpm	xxx.x %	xxx.x %	xx.x°BTDC			
1	2	3	4	◂ Display zones	Specification	Evaluation
				Ignition timing	0.0...12° BTDC	---
			Throttle valve angle Angle sender 1 for throttle valve drive (G187)		0.0...4.0 %	=> Page 55
		Engine load			24.0...34.0 %	=> Page 54
	Engine speed (idling speed)				760...880 rpm	=> Page 50

1) Up-to-date specifications:

=> Exhaust emissions test binder

Note on display zone 3:

Display values must be approx. 100.0 % when accelerator pedal is fully depressed.

Evaluating display group 10, display zone 2 - Engine load

Appears on display	Possible fault cause	Fault elimination
Less than specification	- Lesser values can occur when driving in overrun	
	- Large amount of unmetered air (cannot be compensated for by the idling stabilisation)	- Check intake air system for leaks => Page 128
		- Perform idling check => Page 129
More than specification	- Poor idling speed (does not run on all cylinders)	- Check injectors => Page 118
		- Check spark plugs and ignition leads => Page 171

satelettronica

	- Increased engine load due to electrical consumers, air conditioning, gear selected or P.A.S. on full lock	- Eliminate increased load (air conditioning, power assisted steering etc.)
	- Throttle valve control part (J338) sticking/ defective	- Check throttle valve control part => Page 108
	- Air mass meter (G70) defective	- Check air mass meter => Page 102
	- Large amount of unmetered air (cannot be compensated for by the idling stabilisation)	- Check intake air system for leaks => Page 128
		- Perform idling check => Page 129

Evaluating display group 10, display zone 3 - Throttle valve angle, throttle valve drive angle sender 1

Appears on display	Possible fault cause	Fault elimination
More than specification	- Engine control unit not matched to throttle valve control part	- Erase learnt values and match engine control unit anew => Page 147
	- Throttle valve drive angle sender 1 (G187) in throttle valve control part defective	- Check throttle valve control part => Page 108
	- Throttle valve sticking	- Eliminate cause

Display group 12 -Ignition- Position of camshaft in respect to crankshaft						
▪ Engine running at idling speed						
Read measured value block 12 ⇒				◂ Indicated on display		
xxxx rpm	xxx.x %	xx	xx			
1	2	3	4	◂ Display zones	Specification	Evaluation
				Number of crankshaft sprocket tooth on camshaft signal edge change from high >low	86...90	---
				Number of crankshaft sprocket tooth on camshaft signal edge change from low >high	26...30	---
				Engine load	24.0...34.0 %	=> Page 54
				Engine speed (idling speed)	760...880 rpm	=> Page 50

1) Up-to-date specifications:

=> Exhaust emissions test binder

Notes on display zones 3 and 4:

- The engine speed sender (G28) on the crankshaft transmits both an engine speed signal and a reference mark signal. The reference mark signal is generated by a gap in the sender wheel.
- The Hall sender (G40) rotor ring on the camshaft has a 180°division so that for one half of each camshaft revolution it covers the window on the Hall sender and for the other half-revolution the window is exposed.
- To synchronise the components when starting, the engine control unit records the instant when the rotor ring begins to cover the window (signal change from - to +) and the instant when it begins to expose the window (signal change from + to -).
- When the reference mark signal on the crankshaft is detected, the engine control unit counts the number of teeth on the crankshaft-mounted sender wheel. As soon as it has counted between 26 and 30 teeth after the gap, the signal sent by the Hall sender on the camshaft should change from - to + (rotor ring begins to cover window). After between 86 and 90 teeth, with the crankshaft already making its second revolution, the Hall sender signal should change from + to - (rotor ring begins to expose window).
- If the signal does not change within the tooth ranges specified above, this may mean that the toothed belt has slipped.

Display group 14 -Ignition- Misfire recognition

Protected by copyright. Copying for private or commercial purposes, in part or in whole, is not permitted unless authorised by Volkswagen AG. Volkswagen AG does not guarantee or accept any liability with respect to correctness of information in this document. Copyright by Volkswagen AG.

satelettronica

▪ Whilst driving						
Read measured value block 14			⇒	◂ Indicated on display		
xxxx rpm	xxx.x %	xxx	Text			
1	2	3	4	◂ Display zones	Specification	Evaluation
				Misfire recognition (inactive, activated)	activated	---
			Misfire total		0...20	=> Page 56
		Engine load			24.0...100.0 %	---
	Engine speed				760...6350 rpm	---

Note on display zone 3:

The total number of misfires is displayed from the time the engine was started. The specification is only valid for max. 5 minutes after the engine has been started.

Evaluating display group 14, display zone 3 - Total number of misfires

Appears on display	Possible fault cause	Fault elimination
More than specification	- Spark plug defective - Spark plug connector defective - Ignition transformer (N152) defective - Ignition transformer final output stage (N122) defective	- Check spark plugs and ignition/HT wiring with connector => Page 177
	- Injector defective	- Check injectors => Page 118
	- Large amount of unmetered air (cannot be compensated for by the idling stabilisation)	- Check intake air system for leaks => Page 128
	- Exhaust gas recirculation valve (N18) sticking/defective	- Check exhaust gas recirculation valve => Page 25 , Final control diagnosis
	- Timing adjusted incorrectly	- Check timing: => Repair group 15; Removing and installing cylinder head, Removing and installing toothed belt, Tensioning

Display group 15 -Ignition- Misfire recognition Cyl. 1 to Cyl. 3						
▪ Whilst driving

satelettronica

Significance if display = 1			
		1	Lambda regulation active

Display group 31 -Lambda regulation- constantly operating Lambda probes						
▪ Engine running at idling speed Read measured value block 31 ⇒ ◂ Indicated on display x.xxxx x.xxxx						
1	2	3	4	◂ Display zones	Specification	Evaluation
		Lambda specification, Bank 1			0.9900...1.0100	---
	Lambda actual value, Bank 1				0.9600...1.0400	---

Display group 32 -Lambda regulation- Learnt values for Lambda probe before catalyst						
▪ Engine running at idling speed Read measured value block 32 ⇒ ◂ Indicated on display xx.x % xx.x %						
1	2	3	4	◂ Display zones	Specification	Evaluation
		Lambda learnt value at part-throttle (multiplicative) before catalyst			-20.0...20.0 %	=> Page 60
	Lambda learnt value at idling speed (additive) before catalyst				-15.0...15.0 %	=> Page 60

Notes on display zones 1 and 2:

Low values indicate that the engine is running too rich and therefore the Lambda regulation is weakening the mixture.

- High values indicate that the engine is running too lean and therefore the Lambda regulation is enrichening the mixture.
- add = additive - The effects of the fault (e.g. unmetered air) will reduce as the engine speed increases. The injection period will be modified by a fixed amount for additive learnt values. This amount is not dependent upon the basic injection period.
- mul = multiplicative - The effects of the fault (e.g. faulty injector) will increase as the engine speed increases. A multiplicative learnt value is a proportional change to the injection period. This change is dependent on the basic injection period.

Evaluating display group 32, display zones 1 and 2 - Lambda learnt values before catalyst

Appears on display	Possible fault cause	Fault elimination
Low Lambda learnt values	- Low learnt values at idling but with normal learnt values at part throttle: possible oil dilution (high level of fuel in oil)	- Disappears after motorway drive or oil change
	- Injector leaking	- Check injector =>Page 118
	- Air mass meter (G70) defective	- Check air mass meter => Page 102
	- Activated charcoal filter solenoid valve 1 (N80) permanently open	- Check activated charcoal filter solenoid valve 1 => Page 25 , Final control diagnosis
	- Lambda probe heating (Z19) defective or Lambda probe (G39) soiled	- Check Lambda probe heating beore catalyst =>Page 95

		Engine speed (idling speed specification)			760...880 rpm	---

satelettronica

Engine speed (idling speed)	760...880 rpm	=> Page 50

1) Up-to-date specifications:

=> Exhaust emissions test binder

Note on display zone 2:

The specified engine speed from the engine control unit is displayed (temperature dependent internally calculated control unit value).

Display group 57 -Speed regulation- Idling speed stabilisation						
▪ Engine running at idling speed						
Read measured value block 57			⇒	◂ Indicated on display		
xxxx rpm	xxxx rpm	Text	xx %			
1	2	3	4	◂ Display zones	Specification	Evaluation
				A/C operating mode ▪ Air conditioning off ▪ Air conditioning on	0...2 % 15...80 % (fluctuates)	---
				A/C compressor operating mode (Compr. ON / Compr. OFF)	Compr. ON or Compr. OFF	---
				Engine speed (idling speed specification) ▪ A/C compressor off ▪ A/C compressor on	760...880 rpm 850...950 rpm	---
				Engine speed (idling speed) ▪ A/C compressor off ▪ A/C compressor on	760...880 rpm 850...950 rpm	=> Page 50

1) Up-to-date specifications:

=> Exhaust emissions test binder

Note on display zone 2:

The specified engine speed from the engine control unit is displayed (temperature dependent internally calculated control unit value).

Notes on display zone 3:

- "Compr. OFF" is always displayed on vehicles without air conditioner.
- Checking signal from and to air conditioner compressor =>Page 153 .

Notes on display zone 4:

- "0 %" is always displayed for vehicles without air conditioning.
- Checking signal from and to air conditioner compressor =>Page 153 .

Display group 60 -Speed regulation- Adaption EPC system 1)						
▪ Ignition on, engine not running						
▪ Control unit in mode 04 basic setting						
Read measured value block 60			⇒	◂ Indicated on display		
xxx.x %	xxx.x %	x	Text			
1	2	3	4	◂ Display zones	Specification	Evaluation
				Adaption condition (ADP runs / ADP OK / ADP ERROR)	ADP OK	---
				Learning step counter	0...8	---

satelettronica

	Throttle valve angle Throttle valve drive angle sender 2 for (G188)	100.0...0.0 %	---
	Throttle valve angle Throttle valve drive angle sender 1 (G187)	0.0...100.0 %	---

1) Erase learnt values and adapt engine control unit to throttle valve control part and exhaust gas recirculation valve => Page 147 .

Note on display group 60:

- Matching the throttle valve control part is performed with ignition switched on.
- Engine control unit is adapted to throttle valve control unit when selecting display group 60 under function 04 "Basic setting". This adaption must always be carried out when another throttle valve control part (or another complete engine) or another engine control unit is fitted.
- The throttle valve control part angle senders counter oppose one another. The values of both senders added together always equal approx. 100 %.
- The specifications indicated in display zones 1 and 2 do not fully reach the max. min. figures.
- During adaption the counter in display zone 3 counts up from 0 to 8.

Display group 62 -Speed regulation- Electronic accelerator system						
▪ Ignition on, engine not running						
Read measured value block 62 ⇒				◂ Indicated on display		
xxx.x %	xxx.x %	xxx.x %	xxx.x %	◂ Display zones	Specification	Evaluation
1	2	3	4	Accelerator pedal position sender 2 (G185)	3.0...48.0 %	---
				Accelerator pedal position sender 1 (G79)	6.0...96.0 %	---
				Throttle valve angle Throttle valve drive angle sender 2 for (G188)	100.0...0.0 %	---
				Throttle valve angle Throttle valve drive angle sender 1 (G187)	0.0...100.0 %	---

Notes on display group 62:

- The throttle valve control part potentiometer and the pedal value sender are installed in pairs for reasons of safety. The engine control unit continually checks the plausibility of the potentiometer.
- The value from accelerator pedal position sender 2 (G185) must always display approx. half the value from accelerator pedal position sender 1 (G79).
- The throttle valve control part angle senders counter oppose one another. The values of both senders added together always equal approx. 100 %.
- The specifications do not fully reach the max. min. figures.

Display group 66 -Idling regulation- Additional signals						
▪ Ignition on, engine not running						
Read measured value block 66 ⇒				◂ Indicated on display		
xxx km/h	xxxx	xxx km/h	xxxx	◂ Display zones	Specification	Evaluation

29 Fuel pressure regulator

1.3 - General notes on injection

Servicing ignition part:

=> Repair group 28

- The engine control unit is equipped with self-diagnosis. Before carrying out repairs and fault finding the fault memories of all control units must be interrogated. This is necessary because various control units are interconnected via a data bus. Also the vacuum hoses and connections must be checked (unmetered air).
- Disconnecting and connecting the battery must only be done with the ignition switched off, otherwise the engine control unit could be damaged.
- Fuel hoses in engine compartment must only be secured with spring type clips. The use of clamp or screw type clips is not permissible.
- Components marked with * are checked via the self diagnosis
  => Page 10 , interrogating and erasing fault memory.

satelettronica

- Components marked with **can be checked with the final control diagnosis => Page 25 .
- For trouble-free operation of the electrical components, a voltage of at least 11.5 V is necessary.
- Do not use sealants containing silicone. Particles of silicone drawn into the engine, will not be burnt in the engine and damage the Lambda probe.
- If the engine starts, runs for a short period and then stops after fault finding, repairs or component tests, then the fault may lie with the immobilizer which is blocking the engine control unit. The fault memory must be interrogated and if necessary the control unit matched:

=> Electrical system; Repair group 01; Immobilizer self-diagnosis; Adaption following renewal of engine control unit Immobilizer self-diagnosis Adaption following renewal of engine control unit

- During some checks it is possible that the control unit will recognise and store a fault. Therefore after completing all checks and repairs the fault memory must be interrogated and if necessary erased.
  => Page 10 , interrogating and erasing fault memory

satelettronica

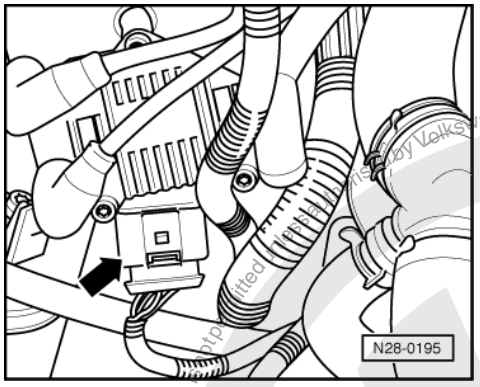
To prevent injuries to persons and/or damage to the fuel injection and ignition system, the following must be noted:

- Do not touch or disconnect ignition wiring when the engine is running or being turned at starter speed.
- The ignition must be switched off before connecting or disconnecting injection or ignition system wiring or tester cables.



- If the engine is to be turned at starter speed, without starting:

- -> Pull 4 pin connector off ignition transformer (N152) -arrow-.

Observe following if test and measuring instruments are required during a test drive:

- Test and measuring instruments must be secured to rear seat and operated by a 2nd person from this location.

  If test and measuring instruments are operated from front passenger's seat and the vehicle is involved in an accident, there is a possibility that the person sitting in this seat may receive serious injuries when the airbag is triggered.

1.9 - Rules for cleanliness

When working on the fuel supply/injection system, pay careful attention to the following "5 rules":

- Thoroughly clean all unions and the adjacent areas before disconnecting.
- Place parts that have been removed on a clean surface and cover. Do not use fluffy cloths!
- Carefully cover opened components or seal, if the repair cannot be carried out immediately.
- Only install clean components:
  Only unpack replacement parts immediately prior to installation.
  Do not use parts that have been stored loose (e.g. in tool boxes etc.).
- When the system is open:
  Do not work with compressed air if this can be avoided.
  Do not move vehicle unless absolutely necessary.

2 - Checking components

2.1 - Checking components

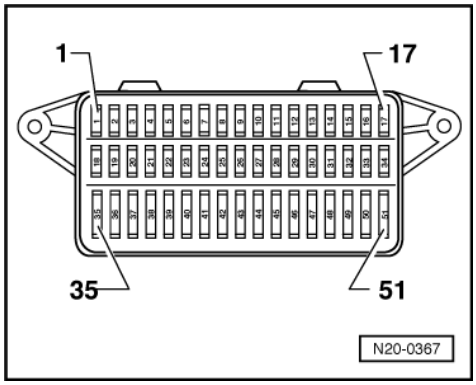
2.2 - Checking Lambda probe heating for Lambda probe before catalyst

Note:

Only gold-plated contacts must be used to repair the contacts in the Lambda probes connectors.

Special tools, workshop equipment, testers, measuring instruments and auxiliary items required

- Hand multimeter V.A.G 1526 or multimeter V.A.G 1715
- Fault reader V.A.G 1551 (or vehicle system tester V.A.G 1552) with cable V.A.G 1551/3
- Adapter set V.A.G 1594



- Test box V.A.G 1598/31
- Current flow diagram

Test conditions

- -> The fuses 1, 31 and 36 must be OK.
- The battery voltage must be at least 11.5 V.
- Earth connection in plenum chamber OK.
- All electrical consumers, e.g. lights and rear window heating must be switched off.
- If the vehicle is equipped with an air conditioning system, this must be switched off.
- Fuel pump relay must be OK =>Page 25 , final control diagnosis.

satelettronica

Test sequence

- Connect fault reader V.A.G 1551 (V.A.G 1552). Start engine and select "Address word" 01 of engine control unit. When doing this the engine must be running at idling speed.
  (Connecting fault reader and selecting engine control unit => Page 4 .)

-> Indicated on display:

```
Rapid data transfer     HELP
Select function XXX
```

- Press keys 0 and 8 for the function "Read measured value block" and confirm entry with Q key.

-> Indicated on display:

```
Read measured value block
Input display group number XXX
```

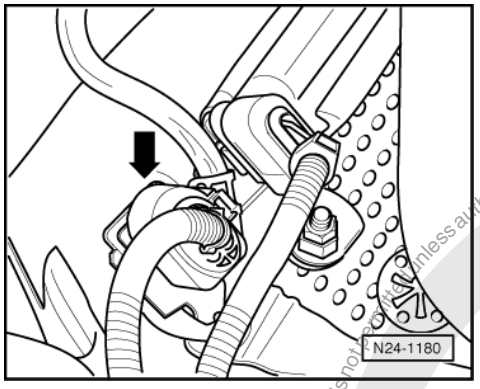
- Press keys 0, 4 and 1 for "Display group number 41" and confirm entry with Q key.

-> Indicated on display:
(1...4 = Display zones)

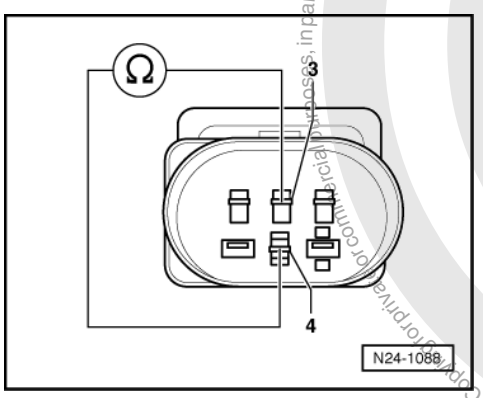
```
Read measured value block 41
     1     2     3     4
```

- Check the status of the Lambda probe heating in display zone 2:
  Display: Htg.bC.ON

If the specification is not obtained:



- Press ⇒key.
- Press keys 0 and 6 for the function "End output" and confirm entry with the Q key.
- Switch off ignition.
- -> Separate 6-pin connector (black) to Lambda probe before catalyst (G39) -arrow-.



- -> Check resistance for probe heater at Lambda probe connector -1- contacts 3 and 4
  Specification: 2.5...10 ω(at room temperature).

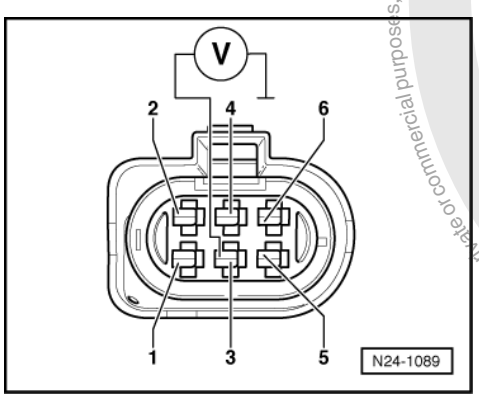
Protected by copyright. Copying for private or commercial purposes, in part or in whole, is not permitted unless authorised by Volkswagen AG. Volkswagen AG does not guarantee or accept any liability with respect to the correctness of information in this document. Copyright by Volkswagen AG.
satelettronica

Note:

The heating element resistance is approx. 2.5...10.0 ω at room temperature. Even slight increases in room temperature increase the resistance greatly.

If the specification is not obtained:

- Renew Lambda probe before catalyst (G39)
  =>Page 71 , item 8 .
- Interrogate fault memory, if necessary, repair any faults and then erase fault memory => Page 10 , interrogating and erasing fault memory.



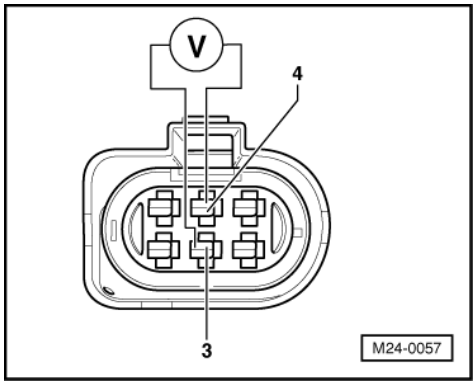
- Erase the learnt values and adapt the engine control unit again=> Page 147

If the specification is obtained:

- -> Set multimeter to measure voltage and connect to contact 3 (connector to engine control unit) and earth.
- Start engine and run at idling speed.
  Specification: 11.0...14.5 V

If the specification is not obtained:

- Switch off ignition.

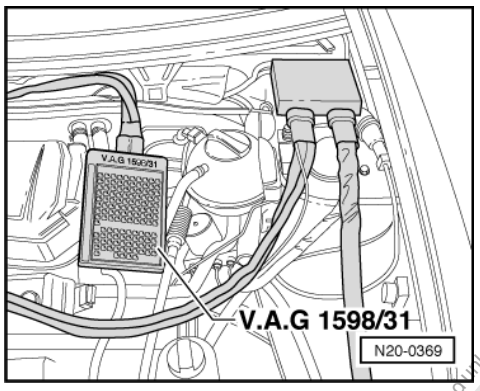


- Check wire for open circuit between 6-pin connector contact 3 and fuel pump relay (J17) using current flow diagram.
  Wire resistance: max. 1.5 ω

If the specification is obtained:

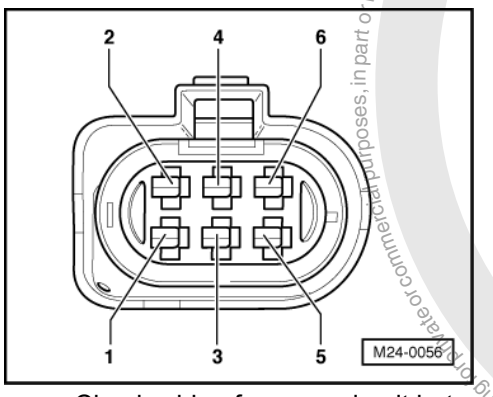
- -> To measure voltage, connect multimeter to contacts 3 + 4 (connector to engine control unit).
  Specification: 11.5...14.5 V
- Switch off ignition.

satelettronica



If the specification is not obtained:

- Remove left cover for plenum chamber.
- -> Connect test box V.A.G 1598/31 to control unit wiring harness. The engine control unit remains disconnected.



- -> Check wiring for open circuit between test box and 6-pin connector referring to current flow diagram:
  Contact 4 and test box socket 4
  Wire resistance: max. 1.5 ω
- Check wiring additionally for short to vehicle earth or battery positive.
  Specification: ∞ω

If the specification is obtained:

- Replace engine control unit
  => Page 145 .

2.3 - Checking Lambda probe heating for Lambda probe after catalyst

Special tools, workshop equipment, testers, measuring instruments and auxiliary items required

- Hand multimeter V.A.G 1526 or multimeter V.A.G 1715

- If the vehicle is equipped with an air conditioning system, this must be switched off.
- Fuel pump relay must be OK =>Page 25 , final control diagnosis.
- Coolant temperature must be at least 80 °C, =>Display group 01, display zone 2.

Test sequence

- Connect fault reader V.A.G 1551 (V.A.G 1552). Start engine and select "Address word" 01 of engine control unit. When doing this the engine must be running at idling speed.
  (Connecting fault reader and selecting engine control unit => Page 4 .)

-> Indicated on display:

```
Rapid data transfer      HELP
Select function XXX
```

- Press keys 0 and 8 for the function "Read measured value block" and confirm entry with Q key.

-> Indicated on display:

```
Read measured value block
Input display group number XXX
```

- Press keys 0, 0 and 1 for "Display group number 1" and confirm entry with Q key.

-> Indicated on display:

(1...4 = Display zones)

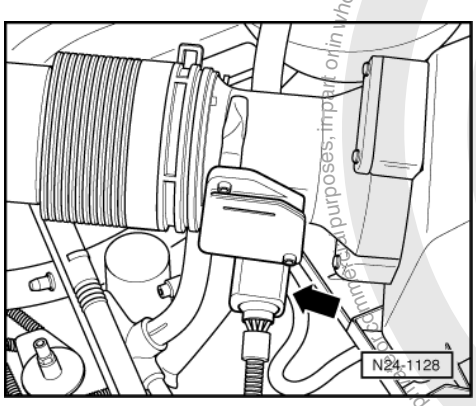
```
Read measured value block 1
     1     2     3     4
```

- Check whether the coolant temperature is above 80 °C in display zone 2.
- Change to display group 2 as follows:
  V.A.G 1551: Press key 3
  V.A.G 1552: Press key ↑

-> Indicated on display:
(1...4 = Display zones)

```
Read measured value block 2
     1     2     3     4
```

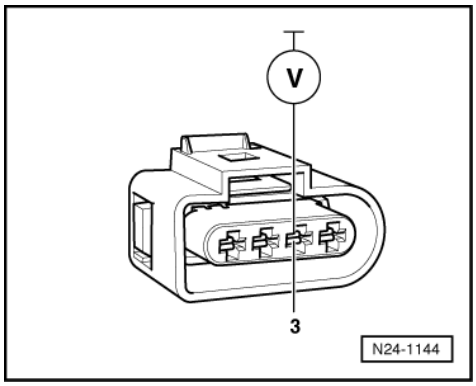
- Check the air mass drawn in in display zone 4
  Specification: 2.0...4.5 g/s
- Press ⇒key.



- Press keys 0 and 6 for the "End output" function and confirm input with the Q key.
- Switch off ignition.

If the specifications are not attained or there is a fault relating to the air mass meter in fault memory:

- -> Pull 4-pin connector off air mass meter (G70) -arrow-.



- -> Connect multimeter to measure voltage at contact 3 (engine control unit connector) + earth.
- Start engine and run at idling speed.
  Specification: 11.0...14.5 V
- Switch off ignition.
- If the voltage supply is OK, test the signal wire and earth wire => Page 104 .

If no voltage is present:

- Check wire for open circuit between contact 3 of 4-pin connector and fuel pump relay (J17) using current flow diagram.

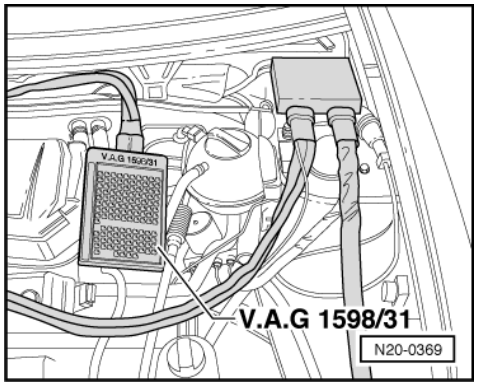
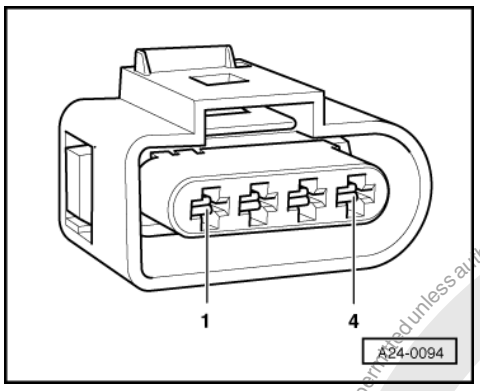
satelettronica

Wire resistance: max. 1.5 ω



Testing signal wiring for air mass meter

- Remove left cover for plenum chamber.
- -> Connect test box V.A.G 1598/31 to control unit wiring harness. The engine control unit remains disconnected.



- -> Check wiring between test box and 4-pin connector for open circuit using current flow diagram:
  Contact 1 and test box socket 10
  Contact 1 and test box socket 11
  Wire resistance: max. 1.5 ω
- Additionally check wires for short to one another, to vehicle earth and to battery positive.
  Specification: ∞ω

If no fault is detected in the wiring:

- Renew air mass meter (G70) with intake air temperature sender (G42) =>Page 91 , item 5 .
- Interrogate fault memory, if necessary, repair any faults and then erase fault memory => Page 10 , interrogating and erasing fault memory.

2.5 - Checking intake air temperature sender

Note:

Only gold-plated contacts may be used to repair the contacts in the air mass meter connector.

Special tools, workshop equipment, testers, measuring instruments and auxiliary items required

- Hand multimeter V.A.G 1526 or multimeter V.A.G 1715
- Fault reader V.A.G 1551 (or vehicle system tester V.A.G 1552) with cable V.A.G 1551/3

     1     2     3     4
```

- Observe intake air temperature in display zone 4 for at least 60 seconds:
  Specification: approx. ambient temperature

If the specification is not obtained:

- Perform check according to following table:

Appears on display	Possible fault cause	Fault elimination

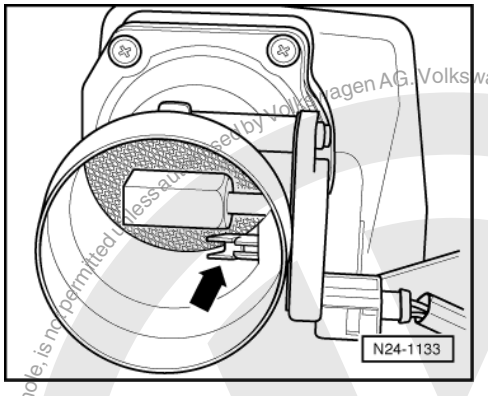
Protected by copyright. Copying for private or commercial purposes, in part or in whole, is not permitted unless authorised by Volkswagen AG. Volkswagen AG does not guarantee or accept any liability with respect to the correctness of information in this document. Copyright by Volkswagen AG.
satelettronica

Above ambient temperature1)	---	Only if a sporadic fault was recognised: Continuation if display is about ambient temperature => Page 106
Constant 9.0 °C or 30.0 °C	- Open circuit or short to positive or earth - Air intake temperature sender defective (G42)	- Continue test if constant 9.0 °C or 30.0 °C is displayed => Page 106

1) If a temperature is displayed which deviates substantially from the ambient temperature, first check sender wiring for transfer resistance, keeping in mind that the sender may be warmed by heat radiated while vehicle is stationary.

2) If the engine control unit recognises a fault from G42, depending on whether the coolant temperature is below or above 70 °C, a delayed constant 9 °C or 30 °C is displayed. For an open circuit (∞ω)e.g.-42.5°C is displayed initially. After approx. 60 seconds, display changes to 9 °C or 30 °C.

Continuation of check when display = ambient temperature:



Functional check of sender

Remove the intake hose between air mass meter and throttle valve control part.
Note intake air temperature value in display zone 4.
-> Spray sender -arrow- with commercial chilling agent whilst observing the temperature value. The temperature value must
decrease.
- Press ⇒key.
- Press keys 0 and 6 for the function "End output" and confirm entry with the Q key.
- Switch off ignition.

If the specification is not obtained:

- Renew air mass meter (G70) with intake air temperature sender (G42) =>Page 91 , item 5 .
- Interrogate fault memory, if necessary, repair any faults and then erase fault memory => Page 10 , interrogating and erasing fault memory.

Continuation of test if constant 9.0°C or 30.0°C is displayed:

- Press ⇒key.
- Press keys 0 and 6 for the function "End output" and confirm entry with the Q key.
- Switch off ignition.

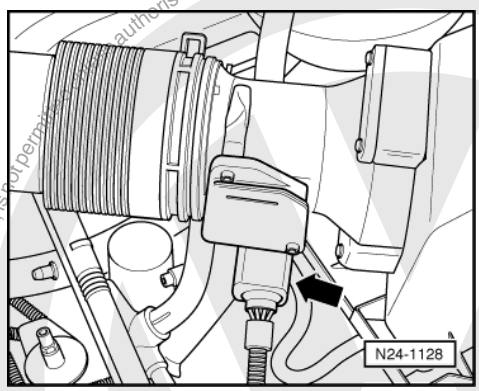
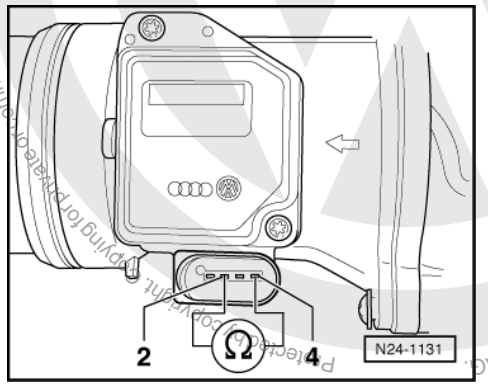
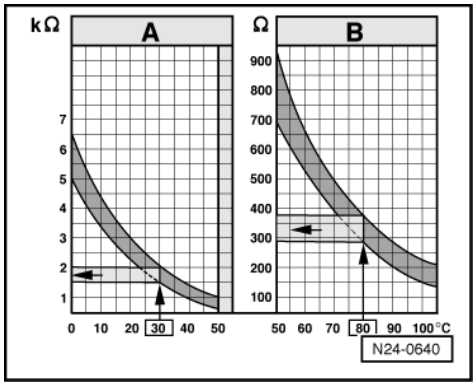
satelettronica



- -> Pull 4-pin connector off air mass meter (G70) -arrow-.



- -> Check resistance from intake air temperature sender between contacts 2 + 4.



-> Specification see diagram

The diagram is divided into two temperature ranges:

A - From 0...50 °C
B - From 50...105 °C

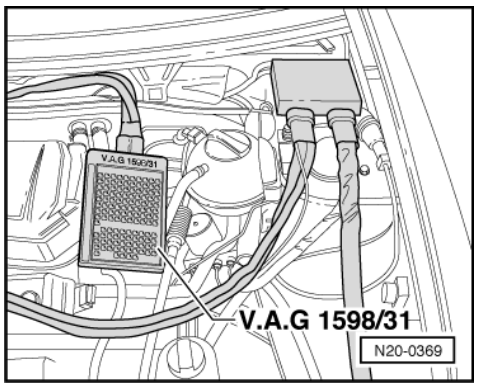
Examples:

- 30 °C is in range A and corresponds to a resistance of 1.5...2.0 kω
- 80 °C is in range B and corresponds to a resistance of 275...375 ω

If the specification is not obtained:

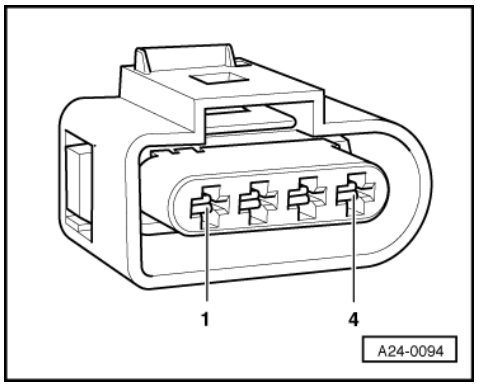
- Renew air mass meter (G70) with intake air temperature sender (G42) =>Page 91 , item 5 .
- Interrogate fault memory, if necessary, repair any faults and then erase fault memory => Page 10 , interrogating and erasing fault memory.

Copyright by Volkswagen AG. Volkswagen AG does not guarantee or accept any liability with respect to the correctness of information in this document. Copying for private or commercial purposes, in part or in whole, is not permitted unless authorised by Volkswagen AG.
satelettronica



If the specification is obtained:

- Remove left cover for plenum chamber.
- -> Connect test box V.A.G 1598/31 to control unit wiring harness. The engine control unit remains disconnected.



- Check wiring between test box and 4-pin connector for open circuit using current flow diagram.
  Contact 2 and test box socket 11
  Contact 4 and test box socket 44
  Wire resistance: max. 1.5 ω
- Additionally check wires for short to one another, to vehicle earth and to battery positive.
  Specification: ∞ω

If there is no fault in the wiring and the resistance measurement values are OK.:

- Replace engine control unit
  => Page 145 .

2.6 - Checking throttle valve control part

Components of throttle valve control part (J338):
Throttle valve drive (G186), angle sender 1 for throttle valve drive (G187) and angle sender 2 for throttle valve drive (G188).

Notes:

- Only gold-plated contacts may be used when servicing the throttle valve control part connector contacts.

If the throttle valve control part is replaced, the following must be carried out:

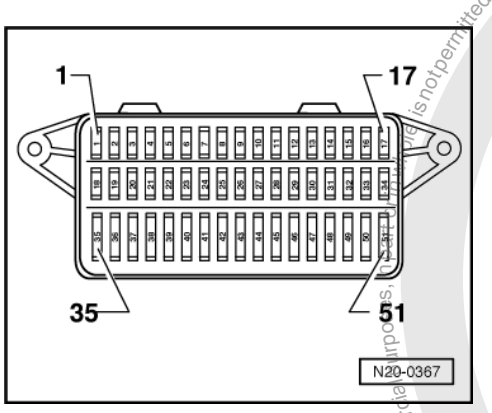
- Erase learnt values and adapt engine control unit to the throttle valve control part => Page 147 .

Copyright by Volkswagen AG. Volkswagen AG does not guarantee or accept any liability with respect to the correctness of information in this document. Copying for private or commercial purposes, in part or in whole, is not permitted unless authorised by Volkswagen AG.
satelettronica

Special tools, workshop equipment, testers, measuring instruments and auxiliary items required

- Hand multimeter V.A.G 1526 or multimeter V.A.G 1715
- Fault reader V.A.G 1551 (or vehicle system tester V.A.G 1552) with cable V.A.G 1551/3
- Adapter set V.A.G 1594
- Test box V.A.G 1598/31
- Current flow diagram
- Mirror

Check conditions



- -> Fuses 13 and 36 must be OK.
- The battery voltage must be at least 11.5 V.
- Earth connection in plenum chamber OK.
- All electrical consumers, e.g. lights and rear window heating must be switched off.
- If the vehicle is equipped with an air conditioning system, this must be switched off.
- The throttle valve control part must not be damaged or dirty (carbonization).
- Coolant temperature must be at least 80 °C, =>Display group 01, display zone 2.

Test sequence

- Connect the fault reader V.A.G 1551 (V.A.G 1552). Then switch ignition on and select engine control unit with the "Address word" 01.
  (Connecting fault reader and selecting engine control unit => Page 4 .)

-> Indicated on display:

```
Rapid data transfer     HELP
Select function XXX
```

- Press keys 0 and 8 for the function "Read measured value block" and confirm entry with Q key.

-> Indicated on display:

```
Read measured value block
Input display group number XXX
```

- Press keys 0, 0 and 1 for "Display group number 1" and confirm entry with Q key.

-> Indicated on display:
(1...4 = Display zones)

```
Read measured value block 1
     1     2     3     4
```

- Check whether the coolant temperature is above 80 °C in display zone 2.
- Change to display group 62 as follows:
- Press C key.

-> Indicated on display:

```
Read measured value block
Input display group number XXX
```

satelettronica

- Press keys 0, 6 and 2 for the "Display group number 62" and confirm entry with Q key.

-> Indicated on display:
(1...4 = Display zones)

```
Read measured value block 62
     1     2     3     4
```

- Check throttle valve angle sender 1 (G187) at idling speed limit stop in display zone 1
  Specification: 0.0...100.0 %
- Check throttle valve angle sender 2 (G188) at idling speed limit stop in display zone 2
  Specification: 100.0...0.0 %
- Depress accelerator slowly to full throttle position and observe angles displayed in display zones 1 and 2:

  The percentage in display zone 1 must rise
  evenly.
  The tolerance range 0.0...100.0 % is never used completely.
  The percentage in display zone 2 must fall
  evenly.
  The tolerance range 100.0...0.0 % is never used completely.

Notes:

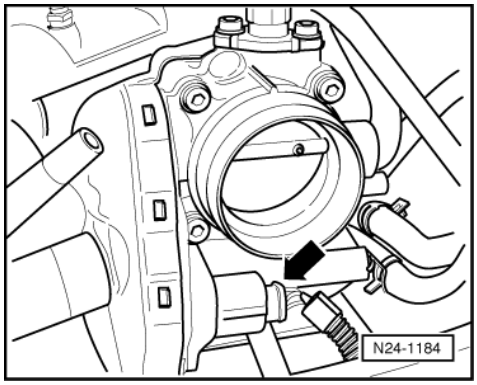
- The reason why the display in display zone 1 increases and the display in display zone 2 decreases is because the potentiometers (angle senders) in the throttle valve control part run in opposite directions.
- This means that the voltage of one angle sender moves towards 5 volts. (The more the throttle valve is opened the higher the voltage; percentage figure increases).

- Whilst the voltage of angle sender 2 decreases from 5 volts towards 0 volts. (The more the throttle valve is opened the lower the voltage; percentage figure decreases).

- Press ⇒key.
- Press keys 0 and 6 for the function "End output" and confirm entry with the Q key.
- Switch off ignition.

If the displays do not indicate as described:

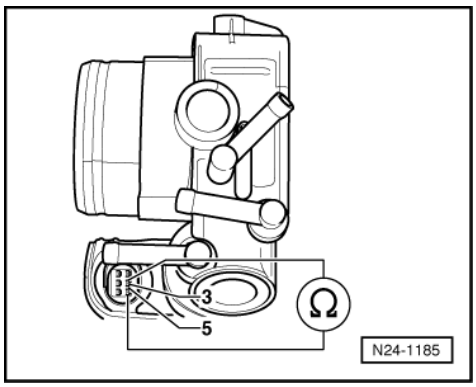
- Remove the intake hose between air mass meter and throttle valve control part.



- -> Pull 6-pin connector off throttle valve control part -arrow-.

Protected by copyright. Copying for private or commercial purposes, in part or in whole, is not permitted unless authorised by Volkswagen AG. Volkswagen AG does not guarantee or accept any liability with respect to the correctness of information in this document. Copyright by Volkswagen AG.

satelettronica



- Measure the throttle valve drive resistance on the throttle valve control unit between contacts 3 + 5.
  Specification: 3.0...200.0 ω (at room temperature)

If the specification is not obtained:

- Replace throttle valve control part (J338)
  =>Page 86 , item 2 .
- Interrogate fault memory, if necessary, repair any faults and then erase fault memory => Page 10 , interrogating and erasing fault memory.
- Erase the learnt values and adapt the engine control unit again=> Page 147 .

If the specification is obtained:

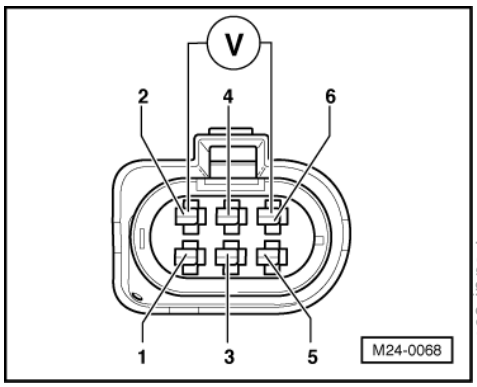
- Check voltage supply of throttle valve control part and wiring to control unit => Page 111 .
- Check the accelerator pedal position sender.

=> Repair group 20; Electronic engine output regulation (electronic accelerator (EPC)); Checking accelerator pedal position sender Electronic engine output regulation (electronic accelerator (EPC)) Checking accelerator pedal position sender

If the voltage supply and wiring is OK:

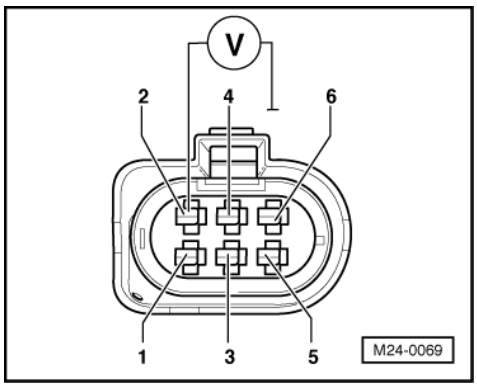
- Replace engine control unit
  => Page 145 .

Checking voltage supply and wiring to control unit



- -> Connect multimeter to measure voltage at connector contacts 2 (positive) + 6 (earth).
- Switch on ignition.
  Specification: min. 4.5 V
- Switch off ignition.

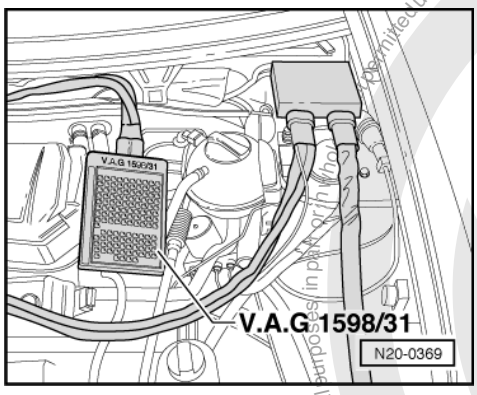
Protected by copyright. Copying for private or commercial purposes, in part or in whole, is not permitted unless authorised by Volkswagen AG. Volkswagen AG does not guarantee or accept any liability with respect to the correctness of information in this document. Copyright by Volkswagen AG.
satelettronica



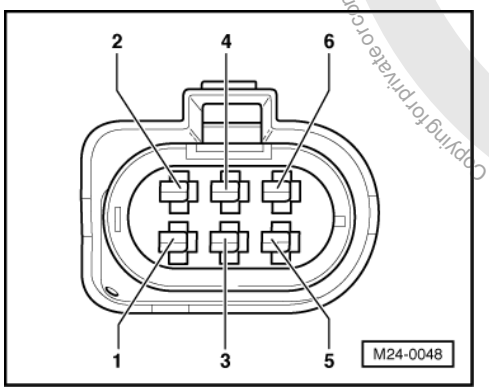
- -> Connect multimeter to measure voltage at connector contact 2 (positive) and earth.
- Switch on ignition.
  Specification: min. 4.5 V
- Switch off ignition.

If the specifications are not attained:

- Remove left cover for plenum chamber.



- -> Connect test box V.A.G 1598/31 to control unit wiring harness. The engine control unit remains disconnected.



- -> Check wiring for open circuit between test box and connector referring to current flow diagram:
  Contact 1 and test box socket 90
  Contact 2 and test box socket 97
  Contact 3 and test box socket119
  Contact 4 and test box socket 92
  Contact 5 and test box socket121
  Contact 6 and test box socket 91
  Wire resistance: max. 1.5 ω
- Additionally check wires for short to one another, to vehicle earth and to battery positive.
  Specification: ∞ω

Protected by copyright. Copying for private or commercial purposes, in part or in whole, is not permitted unless authorised by Volkswagen AG. Volkswagen AG does not guarantee or accept any liability with respect to the correctness of information in this document. Copyright by Volkswagen AG.
satelettronica

If no fault is detected in the wiring:

- Check engine control unit voltage supply => Page 143 .

2.7 - Checking coolant temperature sender

Special tools, workshop equipment, testers, measuring instruments and auxiliary items required

- Hand multimeter V.A.G 1526 or multimeter V.A.G 1715
- Fault reader V.A.G 1551 (or vehicle system tester V.A.G 1552) with cable V.A.G 1551/3
- Adapter set V.A.G 1594
- Test box V.A.G 1598/31
- Current flow diagram

Test conditions

- Engine must be cold.

Test sequence

- Connect the fault reader V.A.G 1551 (V.A.G 1552). Then switch ignition on and select engine control unit with the "Address word" 01.
  (Connecting fault reader and selecting engine control unit => Page 4 .)

-> Indicated on display:

```
Rapid data transfer      HELP
Select function XXX
```

- Press keys 0 and 8 for the function "Read measured value block" and confirm entry with Q key.

-> Indicated on display:

```
Read measured value block
Input display group number XXX
```

- Press keys 0, 0 and 4 for "Display group number 4" and confirm entry with Q key.

-> Indicated on display:
(1...4 = Display zones)

```
Read measured value block 4
     1     2     3     4
```

- Read off coolant temperature value in display zone 3.
  Specification: approx. coolant temperature

If the specification is not obtained:

- Perform check according to following table:

Appears on display	Possible fault cause	Fault elimination
Approx. coolant temperature1)	---	Only when a sporadic fault is detected: When display is coolant temperature, continue with checks => Page 114 2)

Protected by copyright. Copyright by Volkswagen AG. Volkswagen AG does not guarantee or accept any liability with respect to the correctness of information in this document. Copyright by Volkswagen AG. Reproduction in part or in whole is not permitted unless authorised by Volkswagen AG.
satelettronica

Constant 49.5°C or 99.0° C3)	- Wiring open circuit or short to positive or earth - Coolant temperature sender (G62) defective	- Continue test if constant 49.5°C or 99.0° C is displayed => Page 114

1) When a temperature is displayed which deviates greatly from coolant temperature, first check sender wiring for transfer resistance.

2) Check only possible when engine is cold.

3) If the engine control unit recognises a fault in the coolant temperature sender (G62), two fixed replacement values (49.5° C or 99.0° C) are displayed "with ignition on", independent of air intake temperature (less than or above approx. 20° C). A model sequence stored in the control unit is then used to start (continual increase in temperature at set intervals). The temperature in the fault reader display increases therefore even though the connector from G62 is pulled off.

Continuation of check when display = coolant temperature:

Test conditions

- Engine must be cold.

Functional check of sender

- Start engine and run at idling speed.

```
Read measured value block 4
     1      2      3      4
```

-> Observe coolant temperature value in display zone 3 whilst engine is running. The temperature value must
increase steadily.

Notes:

- If the display on fault reader increases in steps of 1.5 °C, this is control unit regulated and not caused by a defective sender.
- If irregular engine running occurs in certain temperature ranges and the temperature figure does not increase without interruption, the temperature signal is temporarily interrupted and the sender must be renewed.

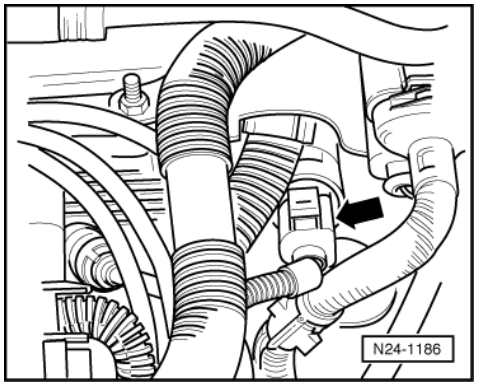
- Press ⇒key.
- Press keys 0 and 6 for the function "End output" and confirm entry with the Q key.
- Switch off ignition.

If the figure does not increase uniformly:

- Replace coolant temperature sender (G62) with coolant temperature gauge sender (G2) =>Page 81 , item 15 .
- Interrogate fault memory, if necessary, repair any faults and then erase fault memory => Page 10 , interrogating and erasing fault memory.

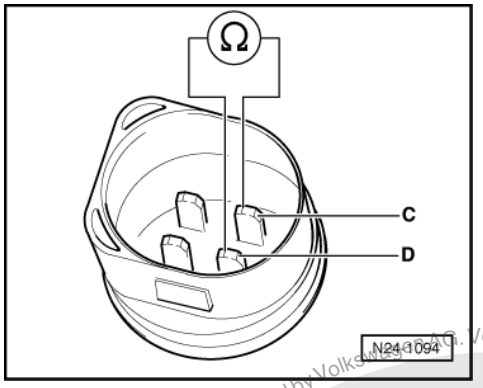
Continuation of test if constant 49.5°C or 99.0°C is displayed:

- Press ⇒key.
- Press keys 0 and 6 for the function "End output" and confirm entry with the Q key.

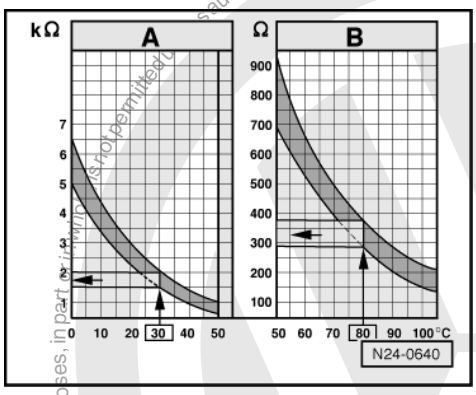


Protected by copyright. Copying for private or commercial purposes, part or complete, is not permitted unless authorised by Volkswagen AG. Volkswagen AG does not guarantee or accept any liability with respect to the correctness of information in this document. Copyright by Volkswagen AG.
satelettronica

- Switch off ignition.
- -> Pull the 4 pin connector off coolant temperature sender (G62) with coolant temperature gauge sender (G2) -arrow-.



- -> Measure resistance of coolant temperature sender between contacts C (signal) and D (earth).



-> Specification see diagram

The diagram is divided into two temperature ranges:

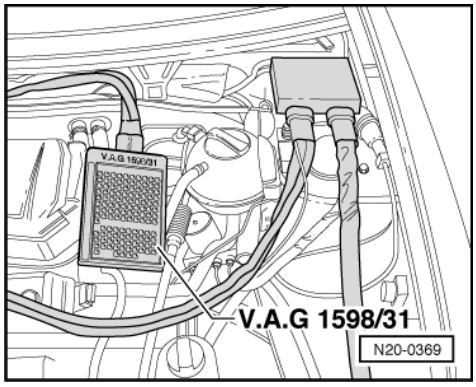
A - From 0...50 °C
B - From 50...105 °C

Examples:

- 30 °C is in range A and corresponds to a resistance of 1.5...2.0 kω
- 80 °C is in range B and corresponds to a resistance of 275...375 ω

If the specification is not obtained:

- Replace coolant temperature sender (G62) with coolant temperature gauge sender (G2) =>Page 81 , item 15 .

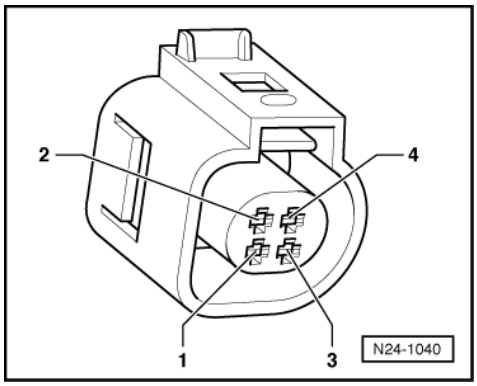


satelettronica

- Interrogate fault memory, if necessary, repair any faults and then erase fault memory => Page 10 , interrogating and erasing fault memory.

If the specification is obtained:

- Remove left cover for plenum chamber.
- -> Connect test box V.A.G 1598/31 to control unit wiring harness. The engine control unit remains disconnected.



- -> Check wiring for open circuit between test box and 4-pin connector referring to current flow diagram.
  Contact 3 and test box socket 104
  Contact 4 and test box socket 83
  Wire resistance: max. 1.5 ω
- Additionally check wires for short to one another, to vehicle earth and to battery positive.
  Specification: ∞ω

If there is no fault in the wiring and the resistance measurement values are OK.:

- Replace engine control unit
  => Page 145 .

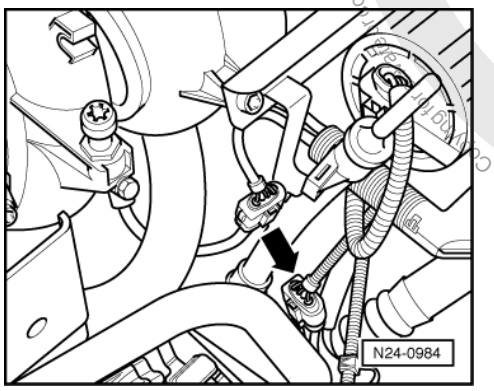
2.8 - Checking engine speed sender

Notes:

- The engine speed sender (G28) is a combined speed sender and reference mark sender.
- The engine can run without a signal from the G28. It is also possible (with considerable difficulty) to start the engine without a signal from the G28 (emergency running function).

Special tools, workshop equipment, testers, measuring instruments and auxiliary items required

- Hand multimeter V.A.G 1526 or multimeter V.A.G 1715
- Adapter set V.A.G 1594



Protected by copyright. Copying for private or commercial purposes, in part or in whole, is not permitted unless authorised by Volkswagen AG. Volkswagen AG does not guarantee or accept any liability with respect to the correctness of information in this document. Copyright by Volkswagen AG.

Volkswagen AG does not guarantee or accept any liability with respect to the correctness of information in this document. Copyright by Volkswagen AG.

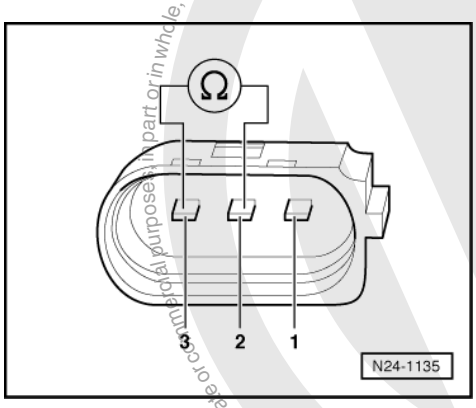
- Test box V.A.G 1598/31
- Current flow diagram

Test sequence

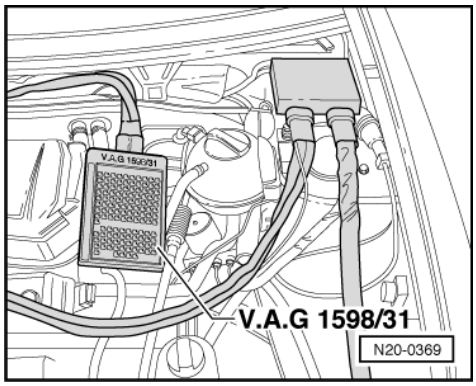
- -> Disconnect the grey 3-pin connector for the engine speed sender -arrow-.



- -> Measure resistance between connector contacts 2 + 3 of engine speed sender.
  Specification: about 730...1000 ω(at room temperature)
- Check the sender for short between contacts 1+3 and 2+3.
  Specification: ∞ω

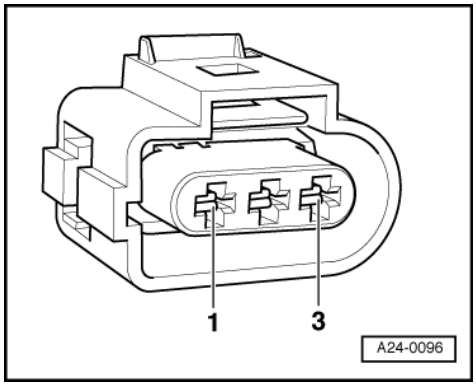
If the specifications are not obtained:

- Replace engine speed sender (G28) =>Page 82 , item 25 .
- Interrogate fault memory, if necessary, repair any faults and then erase fault memory => Page 10 , interrogating and erasing fault memory.



If no sender fault is detected:

- Remove left cover for plenum chamber.
- -> Connect test box V.A.G 1598/31 to control unit wiring harness. The engine control unit remains disconnected.



satelettronica

- -> Check wiring between test box and 3-pin connector for open circuit using current flow diagram.
  Contact 1 and test box socket 99
  Contact 2 and test box socket 98
  Contact 3 and test box socket 106
  Wire resistance: max. 1.5 ω
- Additionally check wires for short to one another, to vehicle earth and to battery positive.
  Specification: ∞ω

If no fault is detected in the wiring:

- Remove sender and check sender wheel for secure fit, damage and run-out.

Note:

There is a larger gap on the sender wheel. This gap is the reference mark and does not mean that the sender wheel is damaged.

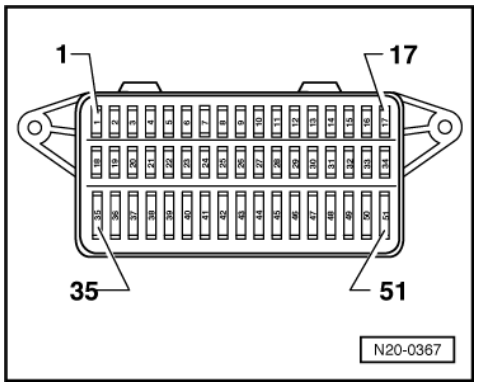
If no fault is detected on sender wheel:

- Replace engine control unit
  => Page 145 .

2.9 - Checking injectors

Special tools, workshop equipment, testers, measuring instruments and auxiliary items required

- Hand multimeter V.A.G 1526 or multimeter V.A.G 1715
- Diode test lamp V.A.G 1527
- Adapter set V.A.G 1594
- Test box V.A.G 1598/31
- Current flow diagram

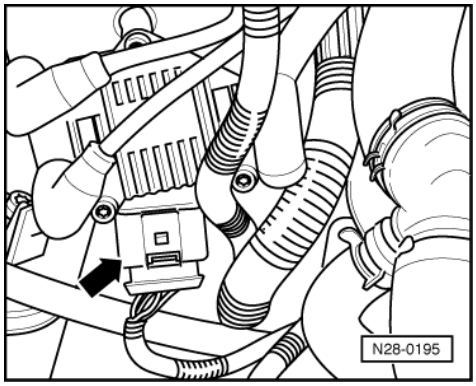


Check conditions

- -> Fuse No. 3 must be OK.
- The battery voltage must be at least 11.5 V.
- Earth connection in plenum chamber OK.
- All electrical consumers, e.g. lights and rear window heating must be switched off.
- If the vehicle is equipped with an air conditioning system, this must be switched off.
- Fuel pump relay must be OK =>Page 25 , final control diagnosis.
- Engine speed sender must be OK, checking =>Page 116 .
- Hall sender must be OK, checking
  =>Page 175 .

Protected by copyright. Copyright by Volkswagen AG. Volkswagen AG does not guarantee or accept any liability with respect to the correctness of information in this document. Copying for private or commercial purposes, in part or in whole, is not permitted unless authorised by Volkswagen AG.
satelettronica

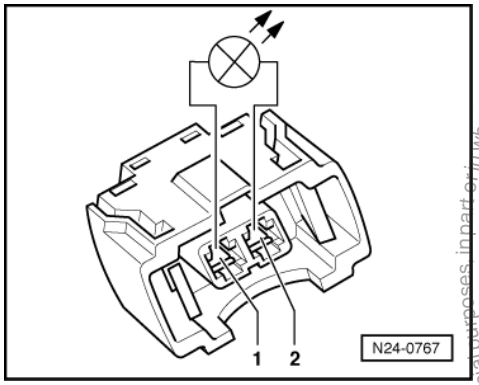
Checking activation and voltage supply



- Remove secondary air pump motor (V101) with bracket:

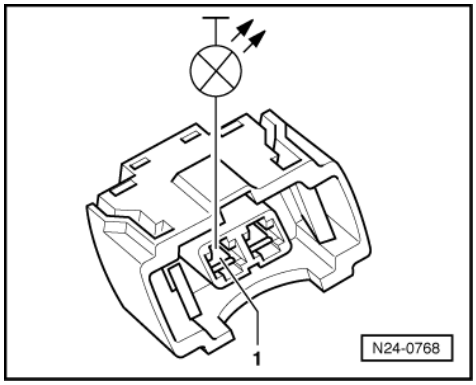
=> Repair group 26; Secondary air system; Removing and installing parts of the secondary air system Secondary air system Removing and installing parts of the secondary air system

- Remove intake manifold upper part => Page 79 , Removing and installing parts of injection system.
- -> Pull 4 pin connector off ignition transformer (N152) -arrow-.
- Pull plug off all injectors.



- -> Connect diode test lamp V.A.G 1527 using aux. cables from V.A.G 1594 to connector contacts of Cyl. 1.
- Operate the starter and check the voltage supply for No. 1 cylinder injector.
  The LED must flash.
- Repeat check at the injector connectors for Cyls. 2...4.
- Switch off ignition.

If the LED does not flash on one or more cylinders:



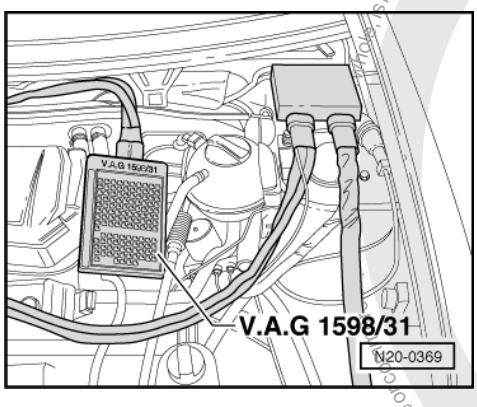
- -> Connect diode test lamp to contact 1 and earth of relevant injector connector.
- Operate the starter and check the voltage supply for No. 1 cylinder injector.
  The LED must light up
- Repeat check at the injector connectors for Cyls. 2...4.

Protected by copyright. Copyright by Volkswagen AG.
Copyright by Volkswagen AG. Volkswagen AG does not guarantee or accept any liability with respect to the correctness of information in this document

- Switch off ignition.

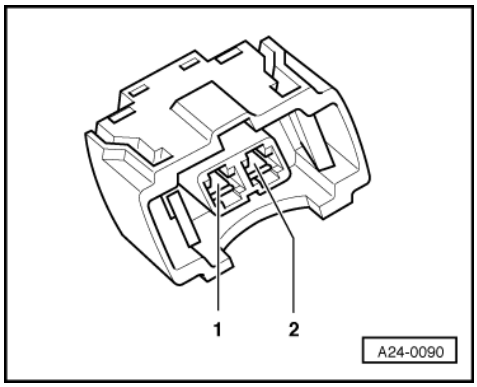
If the LED does not light up:

- Check wire between 2 pin connector contact 1 and fuel pump relay (J17) for open circuit using current flow diagram.
  Wire resistance: max. 1.5 ω



If the LED does not light up on one or several cylinders:

- Remove left cover for plenum chamber.
- -> Connect test box V.A.G 1598/31 to control unit wiring harness. The engine control unit remains disconnected.



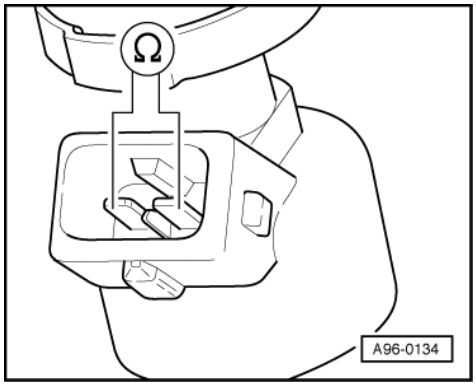
- -> Check wiring for open circuit between test box and 2-pin connector referring to current flow diagram.
  Injector 1: Contact 2 and socket 88
  Injector 2: Contact 2 and socket 87
  Injector 3: Contact 2 and socket 85
  Injector 4: Contact 2 and socket 86
  Wire resistance: max. 1.5 ω
- Additionally check wires for short to one another between contacts 2 to vehicle earth and to battery positive.
  Specification: ∞ω
- Check wiring between connector contacts 1 of injectors for open circuit to one another.
  Wire resistance: Max. 1.5 ω

If no fault is detected in the wiring:

- Check resistance of injectors
  => Page 121 .

Protected by copyright. Copyright by Volkswagen AG.
AG Volkswagen AG does not guarantee or accept any liability with respect to the correctness of information in this document. Copyright by Volkswagen AG.
unless authorised by Volkswagen AG is not permitted
satelettronica

Checking resistance of injectors



- -> Check resistance of injectors between contacts.
  Specification: 12.0...17.0 ω(at room temperature)

Note:

The resistance figures are valid for approx. 20 °C. At higher temperatures the resistance figures will increase.

If the specification is not attained:

- Renew defective injector
  =>Page 89 , item 6 .

Perform installation of injectors in reverse order. When doing this note the following:

- Renew O-rings on all injectors and lightly moisten with clean engine oil.
- Insert injectors vertically and in the correct position into the fuel rail and secure with retaining clips.
- With injectors secured to fuel rail, fit fuel rail on intake manifold lower part and press in evenly.

- Interrogate fault memory, if necessary, repair any faults and then erase fault memory => Page 10 , interrogating and erasing fault memory.
- Erase the learnt values and adapt the engine control unit again=> Page 147 .

If the resistances are OK and no faults can be detected in the wiring:

- Replace engine control unit
  => Page 145 .

satelettronica

Checking spray pattern and for leaks

Special tools, workshop equipment, test and measuring appliances and auxiliary items required

- V.A.G 1331 Torque wrench (5...50 Nm)
- V.A.G 1348/2 B Meter (for injection quantity)
- V.A.G 1594 A Adapter set
- V.A.G 1630 Digital potentiometer

Test conditions

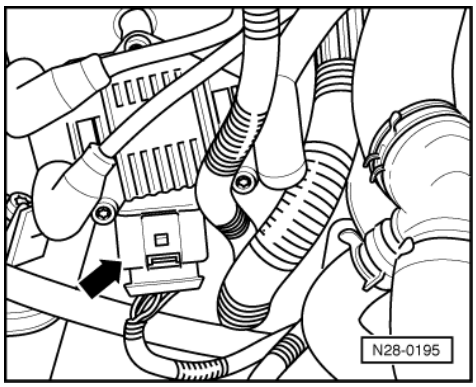
- The fuel pressure must be in order, checking
  => Page 125 , checking fuel pressure regulator and holding pressure.

Test sequence

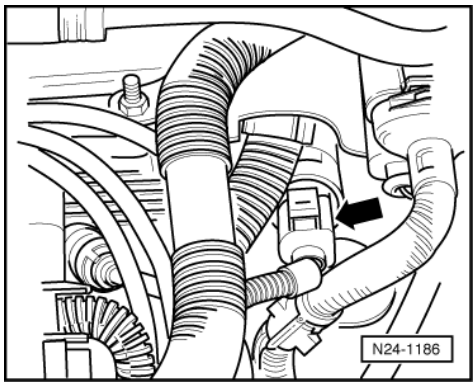
- Remove secondary air pump motor (V101) with bracket:

=> Repair group 26; Secondary air system; Removing and installing parts of the secondary air system Secondary air system Removing and installing parts of the secondary air system

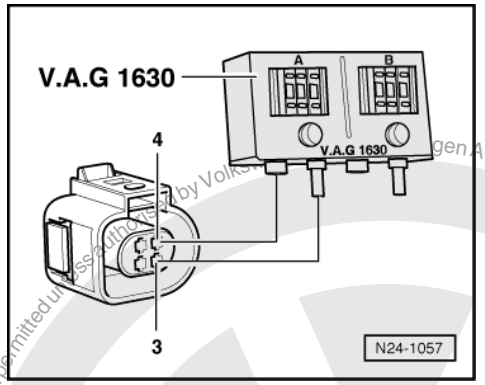
- Remove intake manifold upper part => Page 79 , Removing and installing parts of injection system.



- -> Pull 4 pin connector off ignition transformer (N152) -arrow-.



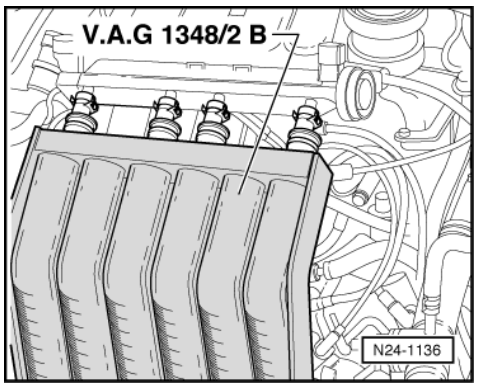
- -> Pull the 4 pin connector off coolant temperature sender (G62) with coolant temperature gauge sender (G2) -arrow-.



- -> Connect digital potentiometer V.A.G 1630 using aux. cables from V.A.G 1594 to connector contacts 3+4 and set connected side to 15 kω.
- Remove fuel rail complete with injectors from intake manifold lower part (reattach fuel hoses and injector connectors)=> Page 80 , item 11 .

Warning!
Fuel supply lines are under pressure! Before removing from hose connection wrap a cloth around the connection. Then release pressure by carefully pulling hose off connection.

Protected by copyright. Copying for private or commercial purposes, in part or in whole, is not permitted unless authorised by Volkswagen AG. Copyright by Volkswagen AG. Volkswagen AG does not guarantee or accept any liability with respect to the correctness of information in this document.
satelettronica



- -> Hold injectors in meter V.A.G 1348/2 B.
- Have 2nd person operate starter. Injector must spray in pulses according to firing order.
- Switch off ignition.
- Switch off ignition and afterwards check injectors for leaks. No more than
  2 drops/min
  may leak from each injector.

If the fuel loss is greater:

- Renew defective injector
  =>Page 89 , item 6 .

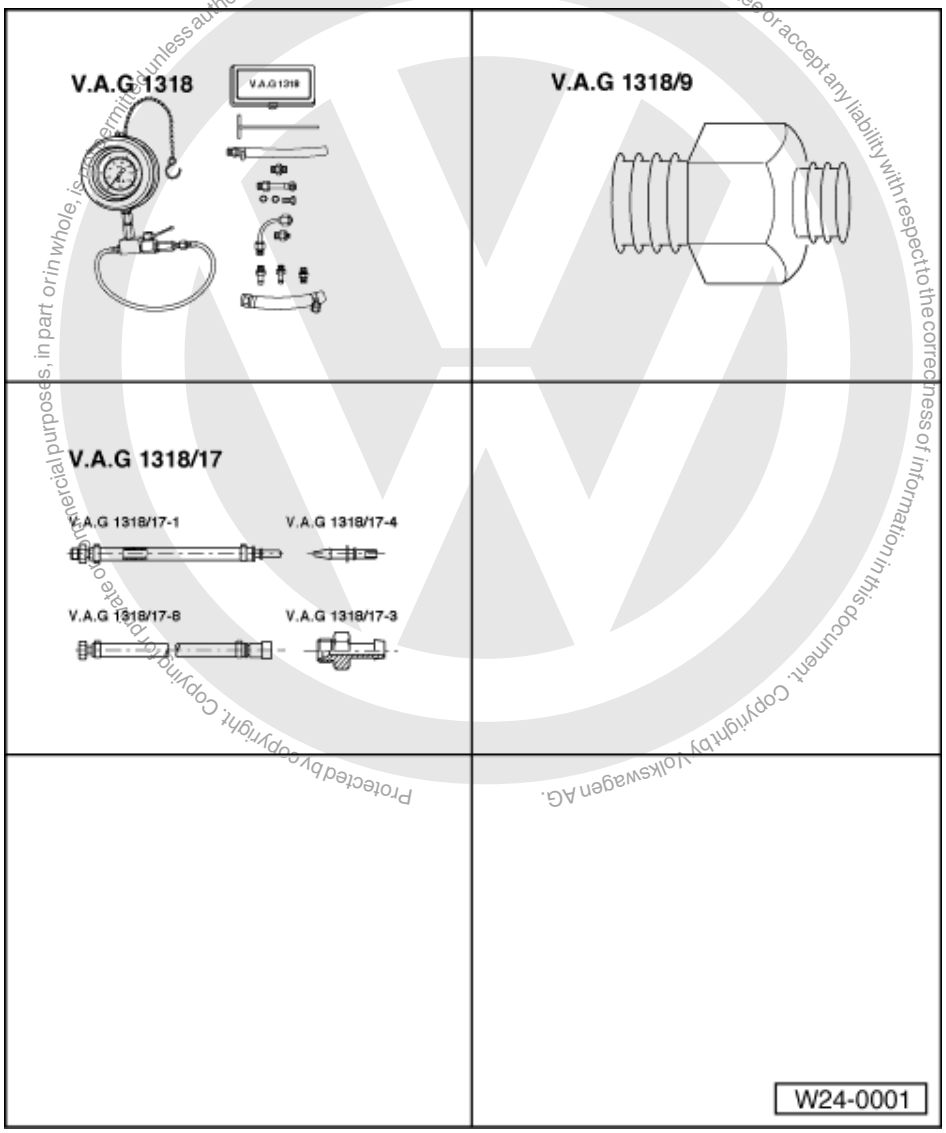
Perform installation of injectors in reverse order. When doing this note the following:

- Renew O-rings on all injectors and lightly moisten with clean engine oil.
- Insert injectors vertically and in the correct position into the fuel rail and secure with retaining clips.
- With injectors secured to fuel rail, fit fuel rail on intake manifold lower part and press in evenly.

- Interrogate fault memory, if necessary, repair any faults and then erase fault memory => Page 10 , interrogating and erasing fault memory.
- Erase the learnt values and adapt the engine control unit again=> Page 147 .

Protected by copyright. Copying for private or commercial purposes, in part or in whole, is not permitted unless authorised by Volkswagen AG. Volkswagen AG does not guarantee or accept any liability with respect to the correctness of information in this document. Copyright by Volkswagen AG.
satelettronica

2.10 - Checking fuel pressure regulator and holding pressure

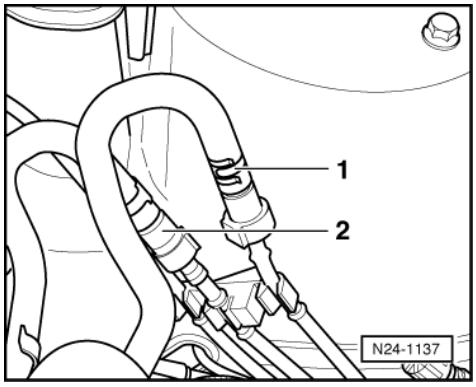


Function

The fuel pressure regulator regulates the fuel pressure depending on intake manifold pressure.

Special tools, workshop equipment, test and measuring appliances and auxiliary items required

- V.A.G 1318 Pressure gauge
- 1318/9 Adapter
- 1318/17 Adapter



satelettronica

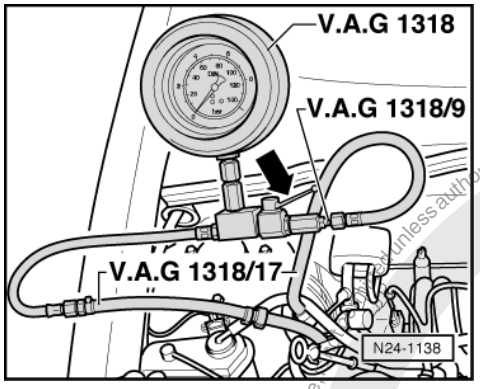
Test sequence

- -> Pull off supply pipe/hose -1- (with white marking) and collect fuel that leaks out with a cloth.

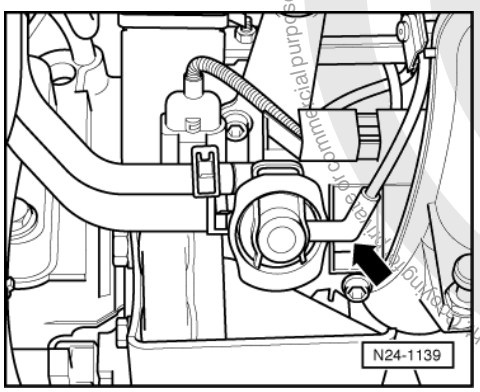
Note:

Press buttons on hose couplings to do this.

Warning!
Fuel supply lines are under pressure! Before removing from hose connection wrap a cloth around the connection. Then release pressure by carefully pulling hose off connection.



- -> Connect pressure tester V.A.G 1318 to fuel supply pipe and to fuel supply hose to fuel rail using adapters 1318/9 and 1318/17.
- Open shut-off tap on pressure gauge. The handle points in direction of flow.
- Start the engine and run at idling speed.
- Measure fuel pressure.
  Specification: Approx. 2.5 bar



- -> Pull the vacuum hose off fuel pressure regulator -arrow-. The fuel pressure must increase to approx. 3.0 bar.
- Switch off ignition.

If the specification is not obtained:

- Check quantity supplied by fuel pump.

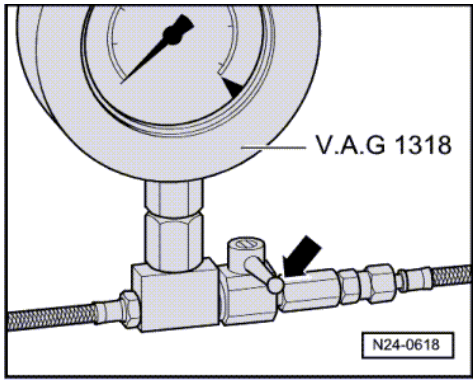
=> Rep. Gr. 20; Removing and installing parts of fuel system; checking fuel pump

If the specification is obtained:

- Check for leaks and holding pressure by observing pressure drop on gauge. After 10 minutes there must be
  a residual pressure of

satelettronica

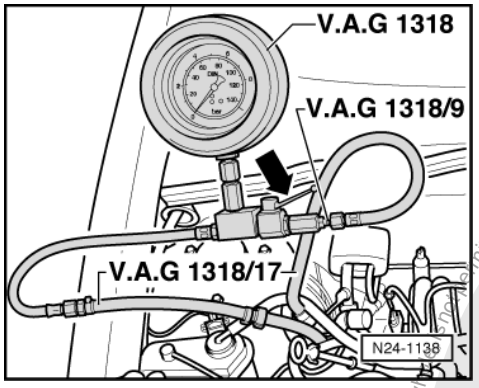
at least 2.0 bar.



If the holding pressure drops below 2 bar:

- Start the engine and run at idling speed.
- -> Switch ignition off after the pressure has built-up. At the same time close pressure measured device cut-off tap (handle cross through-flow direction -arrow-).
- Observe pressure drop on gauge.

If the pressure does not drop:

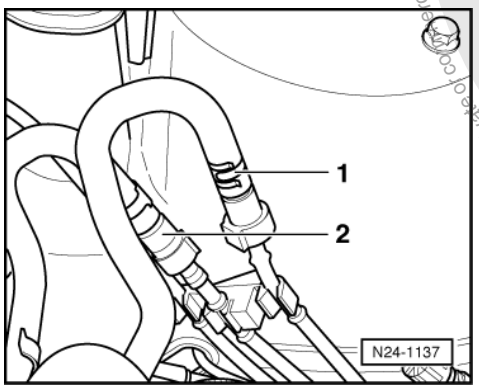


- Check fuel pump non-return valve.

=> Rep. Gr. 20; Removing and installing parts of fuel system; checking fuel pump

If the pressure drops again:

- -> Open pressure tester V.A.G 1318 shut-off tap (handle in through-flow direction).
- Start the engine and run at idling speed.



- -> Switch ignition off after the pressure has build-up. At the same time clamp-off the return hose (with blue marking) -2-.

Protected by copyright. Copying for private or commercial purposes, in part or in whole, is not permitted unless authorised by Volkswagen AG. Volkswagen AG does not guarantee or accept any liability with respect to the correctness of information in this document. Copyright by Volkswagen AG.
satelettronica

If the pressure does not drop:

- Renew fuel pressure regulator
  =>Page 90 , item 10 .

If the pressure drops again:

- Check pipe connections, O rings on fuel manifold and injectors for leaks.
- Check pressure gauge for leaks.

Note:

Before removing pressure gauge place a cloth around the connections to be loosened.

2.11 - Checking intake air system for leaks (unmetered air)

Checking with engine leak detector spray G 001 800 A1

Notes:

- The vacuum in the intake system will cause the leak detector spray to be drawn in with the unmetered air. The leak detector spray reduces the ignitability of the mixture. This leads to a drop in engine speed and to a change of Lambda probe reading.
- The safety precautions listed on the container must be adhered to.

Special tools, workshop equipment, testers, measuring instruments and auxiliary items required

- Fault reader V.A.G 1551 (or vehicle system tester V.A.G 1552) with cable V.A.G 1551/3
- Engine leak detector spray G 001 800 A1

Test conditions

- Coolant temperature must be at least 80 °C, =>display group 01, display zone 2.

Test sequence

- Connect fault reader V.A.G 1551 (V.A.G 1552). Start engine and select "Address word" 01 of engine control unit. When doing this the engine must be running at idling speed.
  (Connecting fault reader and selecting engine control unit => Page 4 .)

-> Indicated on display:

```
Rapid data transfer     HELP
Select function XXX
```

- Press keys 0 and 8 for the function "Read measured value block" and confirm entry with Q key.

-> Indicated on display:

```
Read measured value block
Input display group number XXX
```

- Press keys 0, 0 and 1 for "Display group number 1" and confirm entry with Q key.

-> Indicated on display:
(1...4 = Display zones)

```
Read measured value block 1
     1     2     3     4
```

Only continue with the test when

- The coolant temperature exceeds 80 °C

Copyright by Volkswagen AG. Volkswagen AG does not guarantee or accept any liability with respect to the correctness of information in this document. Copyright by Volkswagen AG. Copy or commercial purposes, in part or in whole, is not permitted unless authorised by Volkswagen AG.
satelettronica

-display zone 2-

- Observe the engine speed in display zone 1 and the Lambda regulation in display zone 3.
- Systematically spray parts of the intake system with engine leak detector spray.

If the engine speed drops or the Lambda regulator changes:

- Press ⇒key.
- Press keys 0 and 6 for the function "End output" and confirm entry with the Q key.
- Switch off ignition.
- Check sprayed areas of intake system for leaks and rectify if necessary.

3 - Checking functions

3.1 - Checking functions

3.2 - Idling check

Notes:

- Idling speed, ignition timing and CO content are not adjustable.
- The idling speed is regulated to specification by the throttle valve control part.
- Lambda regulation keeps the CO content at specification. Faults in Lambda regulation are detected by self-diagnosis and stored in fault memory.

Special tools, workshop equipment, testers, measuring instruments and auxiliary items required

- Fault reader V.A.G 1551 (or vehicle system tester V.A.G 1552) with cable V.A.G 1551/3

Check conditions

- Exhaust system between cylinder head and catalyst free of leaks
- All electrical consumers, e.g. lights and rear window heating must be switched off.
- If the vehicle is equipped with an air conditioning system, this must be switched off.
- Steering not on full lock
- Coolant temperature must be at least 80 °C, =>display group 01, display zone 2.

Test sequence

- Connect fault reader V.A.G 1551 (V.A.G 1552). Start engine and select "Address word" 01 of engine control unit. When doing this the engine must be running at idling speed.
  (Connecting fault reader and selecting engine control unit => Page 4 .)
- Interrogate fault memory, if necessary, repair any faults and then erase fault memory => Page 10 , interrogating and erasing fault memory.
- Then:
  - Leave fault reader V.A.G 1551 connected.
  - Continue running engine at idling speed.

-> Indicated on display:

```
Rapid data transfer      HELP
Select function XXX
```

- Press keys 0 and 8 for the function "Read measured value block" and confirm entry with Q key.

-> Indicated on display:

```
Read measured value block
Input display group number XXX
```

Protected by copyright. Copying for private or commercial purposes, in part or in whole, is not permitted unless authorised by Volkswagen AG. Volkswagen AG does not guarantee or accept any liability with respect to the correctness of information in this document. Copyright by Volkswagen AG.
satelettronica

- Press keys 0, 0 and 1 for "Display group number 1" and confirm entry with Q key.

-> Indicated on display:
(1...4 = Display zones)

```
Read measured value block 1
     1     2     3     4
```

- Check the adjustment conditions in display zone 4. Continue with test first when specifications are achieved.:
  Specification: 1x111111

  Significance of numbers in 8-digit number block
  => Page 50 .

- Briefly increase engine speed (rev- up) and then allow engine to run at idling speed for 2 minutes.

Checking idling speed

- Check idling speed in display zone 1.
  Specification: 760...880 rpm1)

  1) Up-to-date specifications:

=> Exhaust emissions test binder

- Press ⇒key.
- Press keys 0 and 6 for the function "End output" and confirm entry with the Q key.

If the idling speed is not obtained:

- Erase the learnt values and adapt the engine control unit again=> Page 147 .
- Carry out test drive.

Observe the valid safety precautions when carrying out a road test => Page 93 .

- Again interrogate the control unit fault memory.
- Repeat the idling check.

If the specifications are not obtained again:

- Check throttle valve control part
  => Page 108 .
- Check the operating condition of engine
  => Page 139 .
- Check intake system for leaks (unmetered air) => Page 128 .
- Check the signals from/to air conditioning system
  => Page 153 .

3.3 - Checking Lambda probe and Lambda regulation before catalyst

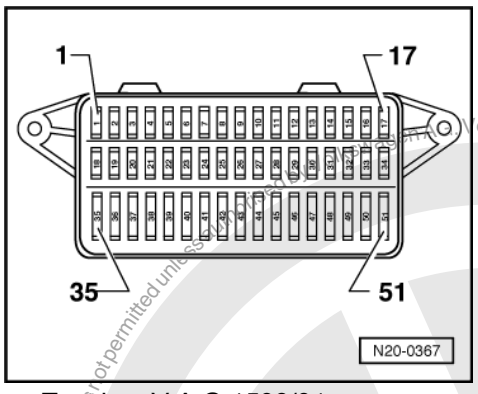
Note:

Only gold-plated contacts must be used to repair the contacts in the Lambda probes connectors.

Special tools, workshop equipment, testers, measuring instruments and auxiliary items required

- Hand multimeter V.A.G 1526 or multimeter V.A.G 1715
- Fault reader V.A.G 1551 (or vehicle system tester V.A.G 1552) with cable V.A.G 1551/3
- Adapter set V.A.G 1594

Protected copyright. Copying for private or commercial purposes, in part or in whole, is not permitted unless authorised by Volkswagen AG. Volkswagen AG does not guarantee or accept any liability with respect to the correctness of information in this document. Copyright by Volkswagen AG.
satelettronica



- Test box V.A.G 1598/31
- Current flow diagram

Check conditions

- -> The fuses 1, 3, 31, 34, 36 and 40 must be OK.
- The battery voltage must be at least 11.5 V.
- Earth connection in plenum chamber OK.
- All electrical consumers, e.g. lights and rear window heating must be switched off.
- If the vehicle is equipped with an air conditioning system, this must be switched off.
- Exhaust system between catalyst and cylinder head must be free of leaks
- No faults must be stored in fault memory => Page 10 , interrogating and erasing fault memory.
- Coolant temperature must be at least 80 °C, =>display group 01, display zone 2.
- Once started, the engine should only be run at idling speed. This allows the interference variable of the exhaust emissions test to be applied and prevents the coolant temperature sender from entering a fault in the fault memory.

  Wait at least 60 seconds before disconnecting the 4-pin connector from coolant temperature sender (G62).

Functional check

- Connect fault reader V.A.G 1551 (V.A.G 1552). Start engine and select "Address word" 01 of engine control unit. When doing this the engine must be running at idling speed.
  (Connecting fault reader and selecting engine control unit => Page 4 .)

-> Indicated on display:

```
Rapid data transfer      HELP
Select function XXX
```

- Press keys 0 and 8 for the function "Read measured value block" and confirm entry with Q key.

-> Indicated on display:

```
Read measured value block
Input display group number XXX
```

- Press keys 0, 0 and 1 for "Display group number 1" and confirm entry with Q key.

-> Indicated on display:
(1...4 = Display zones)

```
Read measured value block 1
     1     2     3     4
```

- Check whether the coolant temperature is above 80 °C in display zone 2.
- Change to display group 30 as follows:
- Press C key.

-> Indicated on display:

```
Read measured value block
Input display group number XXX
```

satelettronica

- Press keys 0, 3 and 0 for the "Display group number 30" and confirm entry with Q key.

-> Indicated on display:
(1...2 = Display zones)

```
Read measured value block 30
     1     2
```

- Check status of Lambda regulation before catalyst (display zone 1):
  Specification: 111

  Significance of numbers in 3-digit number block
  => Page 59 .

If the specification is not obtained:

- Check Lambda probe heating before catalyst
  => Page 95 .

If the specification is obtained:

- Change to display group 32 as follows:
- Press C key.
- Press keys 0, 3 and 2 for "Display group number 32" and confirm entry with Q key.

-> Indicated on display:
(1...2 = Display zones)

```
Read measured value block 32
     1     2
```

- Check Lambda learnt values at idling speed (additive) in display zone 1.
  Specification: -15.0...15.0 %
- Check Lambda learnt values at part load (multiplicative) in display zone 2.
  Specification: -20.0...20.0 %

If the specifications are not obtained:

- Press ⇒key.
- Press keys 0 and 6 for the "End output" function and confirm input with the Q key.
- Switch off ignition.
- =>Page 60 , Evaluating display group 32

If the specifications are obtained:

- Change to display group 33 as follows:
  V.A.G 1551: Press key 3
  V.A.G 1552: Press key ↑

-> Indicated on display:
(1= Display zones)

```
Read measured value block 33
     1
```

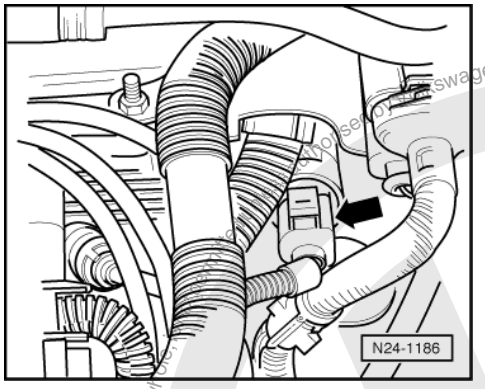
- Check Lambda regulation in display zone 1. The display should fluctuate slightly in the range of -10.0...10.0 %.

If the display in display zone 1 remains at a constant value:

- Press ⇒key.
- Press keys 0 and 6 for the function "End output" and confirm entry with the Q key.
- Switch off ignition.
- Check basic voltage of Lambda probe before catalyst => Page 134 .
- Check Lambda probe wiring for Lambda probe before catalyst
  => Page 134 .

satelettronica

If display fluctuates in display zone 1:



- -> Pull the 4 pin connector off coolant temperature sender (G62) with coolant temperature gauge sender (G2) -arrow-.

Note:
This test will only function if the engine has been running for at least 60 seconds at idling speed only. Once the connector has been disconnected, various component diagnostics and the Lambda regulator are electronically locked for 20 seconds. The fuel/air mixture is made richer and the Lambda probe has to recognise this with an increased display value.

- Observe Lambda regulation in display zone 1:
  The display must fall and then be corrected back to the specifica tion range -10.0...10.0 % within 60 seconds.

If the specification is not obtained:
- Reconnect 4-pin connector from coolant temperature sender (G62).
- Press ⇒key.
- Press keys 0 and 6 for the function "End output" and confirm entry with the Q key.
- Carry out a test drive to remove possible residue on Lambda probe and repeat check.

Observe the valid safety precautions when carrying out a road test => Page 93 .
If specification is not reached following a test drive:
- Renew Lambda probe before catalyst (G39)
  =>Page 71 , item 8 .
- Interrogate fault memory, if necessary, repair any faults and then erase fault memory => Page 10 , interrogating and erasing fault memory.
- Erase the learnt values and adapt the engine control unit again=> Page 147 .

If the specification is obtained:
- Reconnect 4-pin connector to coolant temperature sender (G62) immediately.
- Observe Lambda regulation in display zone 1 again:
  The display must rise and then be corrected back to the specifica tion range -10.0...10.0 % within 60 seconds.
- Press ⇒key.
- Press keys 0 and 6 for the function "End output" and confirm entry with the Q key.
- Switch off ignition.

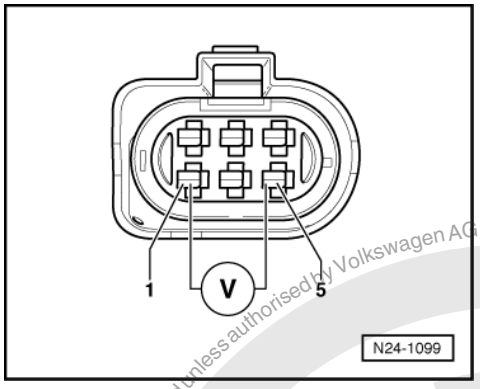
satelettronica

Checking basic voltage of Lambda probe before catalyst

- -> Separate 6-pin connector (black) to Lambda probe before catalyst (G39) -arrow-.



- -> Connect multimeter with aux. cables from V.A.G 1594 to measure voltage at contacts 1 + 5 (connector to engine control unit).
- Switch on ignition and measure basic voltage.
  Specification: 0.40...0.50 V
- Switch off ignition.

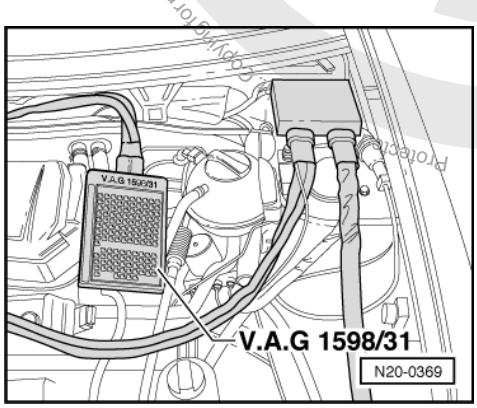
If the specification is not obtained:

- Check Lambda probe wiring for Lambda probe before catalyst
  => Page 134 .

If the specification is obtained:

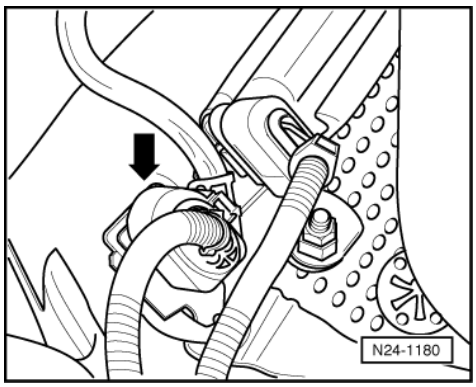
- Renew Lambda probe before catalyst (G39)
  =>Page 71 , item 8 .
- Interrogate fault memory, if necessary, repair any faults and then erase fault memory => Page 10 , interrogating and erasing fault memory.
- Erase the learnt values and adapt the engine control unit again=> Page 147 .

Checking Lambda probe wiring for Lambda probe before catalyst

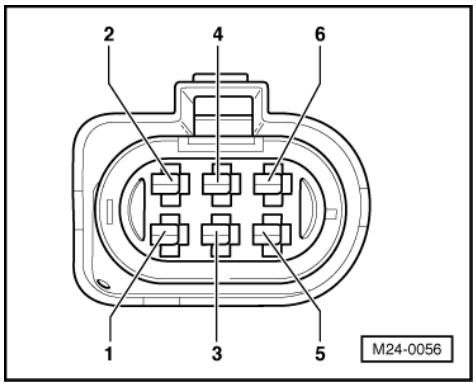


- Remove left cover for plenum chamber.
- -> Connect test box V.A.G 1598/31 to control unit wiring harness. The engine control unit remains disconnected.

Copyright by Volkswagen AG. Volkswagen AG does not guarantee or accept any liability with respect to the correctness of information in this document. Copying for private or commercial purposes, in whole or in part, is not permitted unless authorised by Volkswagen AG.
satelettronica



- -> Separate 6-pin connector (black) to Lambda probe before catalyst (G39) -arrow-.



- -> Check wiring for open circuit between test box and 6-pin connector to control unit referring to current flow diagram.
  Contact 1 and test box socket 14
  Contact 2 and test box socket 15
  Contact 5 and test box socket 34
  Contact 6 and test box socket 33
  Wire resistance: max. 1.5 ω
- Check wiring on 6-pin connector additionally for short to one another.
  Specification: ∞ω

If no fault is detected in the wiring:

- Renew Lambda probe before catalyst (G39)
  =>Page 71 , item 8 .
- Interrogate fault memory, if necessary, repair any faults and then erase fault memory => Page 10 , interrogating and erasing fault memory.
- Erase the learnt values and adapt the engine control unit again=> Page 147 .

3.4 - Checking Lambda probe and Lambda regulation after catalyst

Notes:

- Only gold-plated contacts may be used to repair contacts 3 and 4 in the Lambda probe connectors.
- The Lambda regulation after catalyst is set above the Lambda regulation before catalyst and serves as a means of correction.

Special tools, workshop equipment, testers, measuring instruments and auxiliary items required

- Hand multimeter V.A.G 1526 or multimeter V.A.G 1715
- Fault reader V.A.G 1551 (or vehicle system tester V.A.G 1552) with cable V.A.G 1551/3

```
Read measured value block 1
     1     2     3     4
```

- Check whether the coolant temperature is above 80 °C in display zone 2.
- Change to display group 30 as follows:
- Press C key.

-> Indicated on display:

```
Read measured value block
Input display group number XXX
```

- Press keys 0, 3 and 0 for the "Display group number 30" and confirm entry with Q key.

-> Indicated on display:
(1...2 = Display zones)

satelettronica

```
Read measured value block 30
     1     2
```

- Check Lambda regulation status after catalyst (display zone 2):
  Specification: 111

  Significance of numbers in 3-digit number block
  => Page 59 .

If the specification is not obtained:

- Check Lambda probe heating after catalyst
  => Page 98 .

If the specification is obtained:

- Change to display group 43 as follows:
- Press C key.

-> Indicated on display:

```
Read measured value block
Input display group number XXX
```

- Press keys 0, 4 and 3 for "Display group number 43" and confirm entry with Q key.

-> Indicated on display:
(1...4 = Display zones)

```
Read measured value block 43
     1     2     3     4
```

- Check Lambda probe voltage in display zone 3.
  The voltage must fluctuate slightly in the range of
  0.00...1.00 V.
- Press ⇒key.
- Press keys 0 and 6 for the function "End output" and confirm entry with the Q key.
- Switch off ignition.

If the display in display zone 3 remains at a constant value:

- Continue check according to following table.

Appears on display	Possible fault cause	Fault elimination
Constant approx. 5.00 V	- Short to positive via: - Lambda probe, probe wiring, earth wiring, engine control unit	- Check wiring of Lambda probe after catalyst => Page 138
Constant 0.00 V	- Short to earth via: - Lambda probe, probe wiring, earth wiring, engine control unit	

Protected by copyright. Copying for private or commercial purposes, in part or in whole, is not permitted unless authorised by Volkswagen AG. Volkswagen AG does not guarantee or accept any liability with respect to the correctness of information in this document. Copyright by Volkswagen AG.
satelettronica

Constant between 0.39...0.50 V	- Open circuit via: - Lambda probe, probe wiring, earth wiring, engine control unit	

If the specifications are not reached during operation of Lambda regulation after catalyst or the probe voltage does not fluctuate as stated:

- Carry out a test drive to remove possible residue on Lambda probe and repeat check.

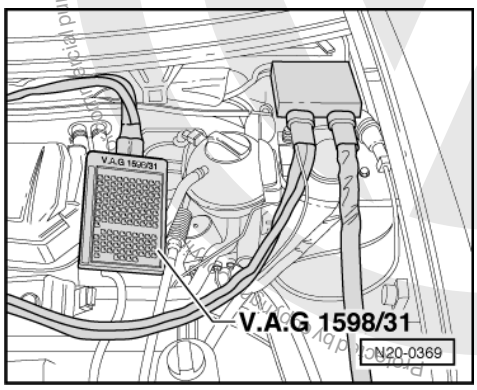
Observe the valid safety precautions when carrying out a road test => Page 93 .

If specification is not reached following test drive:

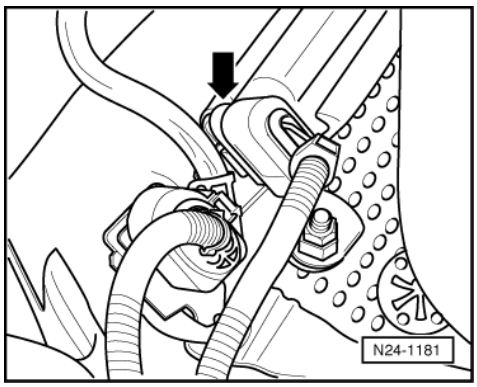
- Replace the Lambda probe after catalyst (G130) => Page 72 , item 9 .
- Interrogate fault memory, if necessary, repair any faults and then erase fault memory => Page 10 , interrogating and erasing fault memory.
- Erase the learnt values and adapt the engine control unit again=> Page 147 .

Checking Lambda probe wiring for Lambda probe after catalyst

- Remove left cover for plenum chamber.

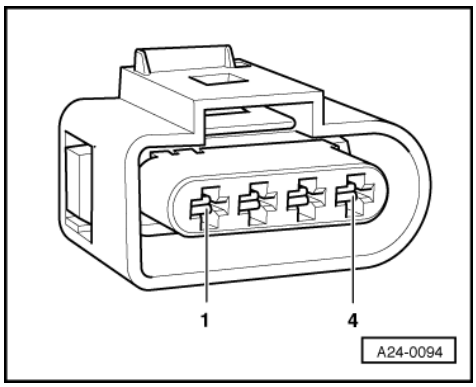


- -> Connect test box V.A.G 1598/31 to control unit wiring harness. The engine control unit remains disconnected.



- -> Separate 4-pin connector (black) to Lambda probe after catalyst (G130) -arrow-.

satelettronica



- -> Check wiring for open circuit between test box and 4-pin connector referring to current flow diagram.
  Contact 3 and test box socket 35
  Contact 4 and test box socket 16
  Wire resistance: max. 1.5 ω
- Additionally check wiring at 4-pin connector for short to one another.
  Specification: ∞ω

If no fault is detected in the wiring:

- Replace the Lambda probe after catalyst (G130) => Page 72 , item 9 .
- Interrogate fault memory, if necessary, repair any faults and then erase fault memory => Page 10 , interrogating and erasing fault memory.
- Erase the learnt values and adapt the engine control unit again=> Page 147 .

3.5 - Checking engine operating mode

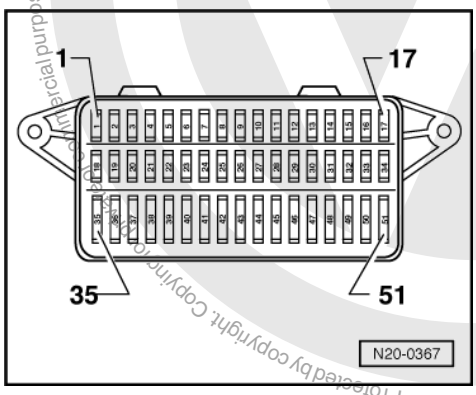
Note:

Checks whether engine control unit recognises the engine operating modes idling, overrun, part throttle, enrichment, full throttle.

Special tools, workshop equipment, testers, measuring instruments and auxiliary items required

◆ Fault reader V.A.G 1551 or vehicle system tester V.A.G 1552 with cable V.A.G 1551/3

Check conditions



- -> Fuses 13 and 36 must be OK.
- Coolant temperature must be at least 80 °C, =>display group 01, display zone 2.

Test sequence

- Connect fault reader V.A.G 1551 (V.A.G 1552). Start engine and select "Address word" 01 of engine control unit. When doing this the engine must be running at idling speed.

satelettronica

(Connecting fault reader and selecting engine control unit => Page 4 .)

-> Indicated on display:

```
Rapid data transfer     HELP
Select function XXX
```

- Press keys 0 and 8 for the function "Read measured value block" and confirm entry with Q key.

-> Indicated on display:

```
Read measured value block
Input display group number XXX
```

- Press keys 0, 0 and 1 for "Display group number 1" and confirm entry with Q key.

-> Indicated on display:
(1...4 = Display zones)

```
Read measured value block 1
     1     2     3     4
```

- Check whether the coolant temperature is above 80 °C in display zone 2.
- Change to display group 5 as follows:
- Press C key.

-> Indicated on display:

```
Read measured value block
Input display group number XXX
```

- Press keys 0, 0 and 5 for "Display group number 5" and confirm entry with Q key.

-> Indicated on display:
(1...4 = Display zones)

```
Read measured value block 5
     1     2     3     4
```

- Check whether the control unit recognises the operating mode (display zone 4):

◆ Idling:

As long as the engine is running at idling speed idling must be displayed
Display: Idling

◆ Overrun mode:

- Increase engine speed to above 3000 rpm.
- Quickly release accelerator pedal.

As long as the engine speed is above 1400 rpm overrun must be displayed
Display: Overrun

Note:

Below 1400 rpm idling speed will be recognised.

◆ Part throttle:

- Rev up evenly.

As long as the engine is being revved up evenly, part throttle must be displayed
Display: Part throt.

◆ Enrichment:

satelettronica

- Floor accelerator pedal (onto throttle valve stop).

  Acceleration enrichment must be displayed briefly
  Display: Enrichment

◆ Full throttle:

- Floor accelerator pedal (onto throttle valve stop).

  Full throttle must be displayed briefly
  Display: Full throttle

Note:

A test drive may have to be performed to show "Full throttle" in display.

Observe the valid safety precautions when carrying out a road test => Page 93 .

- Press ⇒key.
- Press keys 0 and 6 for the function "End output" and confirm entry with the Q key.
- Switch off ignition.

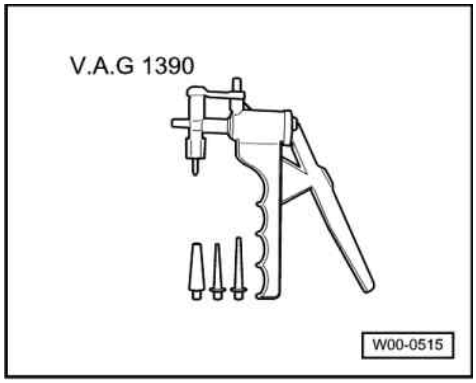
If the specifications are not attained:

- Interrogate fault memory, if necessary, repair any faults and then erase fault memory => Page 10 , interrogating and erasing fault memory.
- Check throttle valve control part
  => Page 108 .

3.6 - Checking intake manifold change-over

The check need only be carried out when performance is poor.

Special tools, workshop equipment, testers, measuring instruments and auxiliary items required

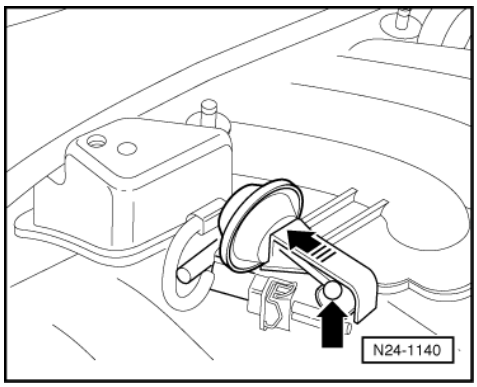


◆ Hand vacuum pump V.A.G 1390
◆ Hand multimeter V.A.G 1526 or multimeter V.A.G 1715
◆ Fault reader V.A.G 1551 (or vehicle system tester V.A.G 1552) with cable V.A.G 1551/3
◆ Adapter set V.A.G 1594
◆ Test box V.A.G 1598/31
◆ Current flow diagram

Checking function

- Start engine and run at idling speed.

Protected by copyright. Copying for private or commercial purposes, in part or in whole, is not permitted unless authorised by Volkswagen AG. Volkswagen AG does not guarantee or accept any liability with respect to the correctness of information in this document. Copyright by Volkswagen AG.
satelettronica



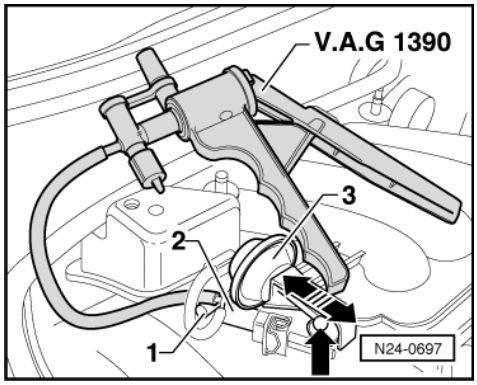
- Increase engine speed abruptly (throttle burst). The intake manifold change-over vacuum unit must operate in direction of arrow during this.

If change-over does not occur, the following checks must be carried out.

- Switch off ignition.
- First check activation of twin path intake manifold change-over valve (N156) via final control diagnosis => Page 25 .

If activation is OK:

- The fault reader or the vehicle system tester must remain connected.



- -> Pull vacuum hose -1- off intake manifold change-over valve -2- and connect hand vacuum pump V.A.G 1390 to connection.
- Perform final control diagnosis again. When the valve for intake manifold change-over is activated, operate hand pump uniformly.
  The actuator -3- must switch to and fro between both positions.

If the change-over does not function as described:

- Check change-over mechanics for freedom of movement. To do this operate rods by hand.
- Check vacuum pipes for correct connection.
- Check vacuum system including vacuum reservoir in intake manifold upper part for leaks.

Protected by copyright. Copying for private or commercial purposes, in part or in whole, is not permitted unless authorised by Volkswagen AG. Volkswagen AG does not guarantee or accept any liability with respect to the correctness of information in this document. Copyright by Volkswagen AG.
satelettronica

4 - Engine control unit

4.1 - Engine control unit

4.2 - Function

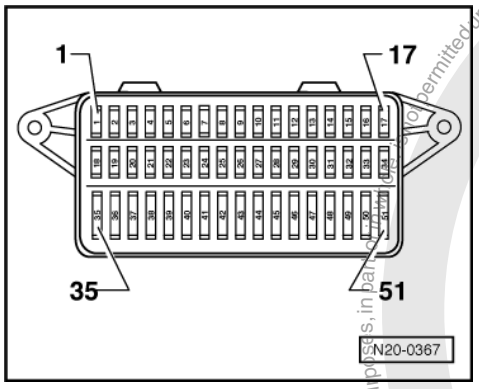
Following evaluation of the input signals, the engine control unit regulates injection, throttle valve control part, ignition, activated charcoal filter solenoid valve 1, governed speed, overrun shut-off, variable intake manifold, exhaust gas recirculation, secondary air system and self-diagnosis.

4.3 - Checking control unit voltage supply

Special tools, workshop equipment, testers, measuring instruments and auxiliary items required

- Hand multimeter V.A.G 1526 or multimeter V.A.G 1715
- Fault reader V.A.G 1551 (or vehicle system tester V.A.G 1552) with cable V.A.G 1551/3
- Adapter set V.A.G 1594
- Test box V.A.G 1598/31
- Current flow diagram

Check conditions



- -> Fuses 13 and 36 must be OK.
- The battery voltage must be at least 11.5 V.
- Earth connection in plenum chamber OK.
- All electrical consumers, e.g. lights and rear window heating must be switched off.
- If the vehicle is equipped with an air conditioning system, this must be switched off.
- Alternator OK, checking:

=> Current flow diagrams, Electrical fault finding and Fitting locations

Test sequence

- Connect fault reader V.A.G 1551 (V.A.G 1552). Start engine and select "Address word" 01 of engine control unit. When doing this the engine must be running at idling speed.
  (Connecting fault reader and selecting engine control unit => Page 4 .)

-> Indicated on display:

```
Rapid data transfer      HELP
Select function XXX
```

- Press keys 0 and 8 for the function "Read measured value block" and confirm entry with Q key.

-> Indicated on display:

satelettronica

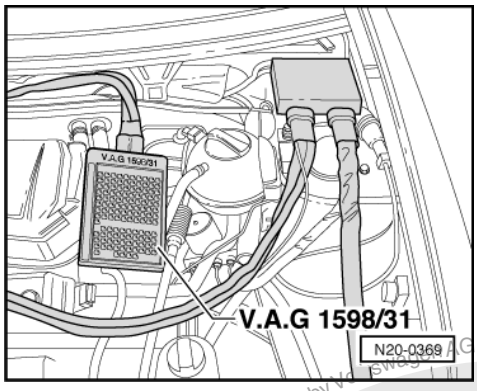
```
Read measured value block
Input display group number XXX
```

- Press keys 0, 0 and 4 for "Display group number 4" and confirm entry with Q key.

-> Indicated on display:
(1...4 = Display zones)

```
Read measured value block 4
     1     2     3     4
```

- Read off figure displayed in display zone 2.
  Specification: At least 11.5 V
- Press the ⇒key.
- Press keys 0 and 6 for the "End output" function and confirm input with the Q key.



- Switch off ignition.

If the specification is not attained:

- Remove left cover for plenum chamber.
- -> Connect test box V.A.G 1598/31 to control unit wiring harness. The engine control unit remains disconnected.

Testing voltage supply for Simos control unit current supply relay (J363)

- Measure voltage supply using multimeter and auxiliary cables from V.A.G 1594 between test box sockets 1 + 3 and 2 + 3.
- Switch on ignition.
  Specification: min. 11.5 V
- Switch off ignition.

If the specification is not attained:

- Check wiring connections to Simos control unit voltage supply relay (J363) on relay plate, relay position 4 and earth connections of engine control unit using current flow diagram:

=> Current flow diagrams, Electrical fault finding and Fitting locations

- Interrogate fault memory, if necessary, repair any faults and then erase fault memory => Page 10 , interrogating and erasing fault memory.
- Erase the learnt values and adapt the engine control unit again=> Page 147 .

Checking voltage supply terminal 15

- Measure supply voltage with multimeter and adapter cables from V.A.G 1594 between sockets 1 + 62 and 2 + 62 of test box:
- Switch on ignition.
  Specification: min. 11.5 V
- Switch off ignition.

satelettronica

If the specification is not attained:

- Check wiring connection to fuse carrier and earth connections of engine control unit using current flow diagram:

=> Current flow diagrams, Electrical fault finding and Fitting locations

- Interrogate fault memory, if necessary, repair any faults and then erase fault memory => Page 10 , interrogating and erasing fault memory.
- Erase the learnt values and adapt the engine control unit again=> Page 147 .

4.4 - Replacing engine control unit

Special tools, workshop equipment, testers, measuring instruments and auxiliary items required

◆ Fault reader V.A.G 1551 with cable V.A.G 1551/3

Work sequence

- First print out the control unit identification and thereby the previous control unit coding as follows:
- Connect the fault reader V.A.G 1551 (V.A.G 1552). Then switch ignition on and select engine control unit with the "Address word" 01.
  (Connecting fault reader and selecting engine control unit => Page 4 .)

-> The control unit identification and coding are indicated on the display e.g.:

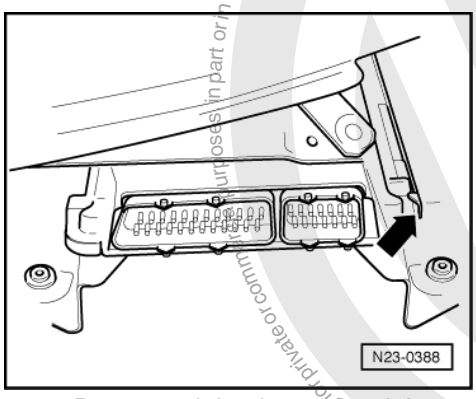
```
6K0906033A 1.6l/2V SIMOS3 00HSS105 "
Coding 00011     WSC XXXXX
```

- Print out the control unit identification by pressing the fault reader print button.
- Press the ⇒key.
- Press keys 0 and 6 for the function "End output" and confirm entry with the Q key.

-> Indicated on display:

```
Rapid data transfer     HELP
Select function XXX
```

- Switch off ignition.
- Remove left cover for plenum chamber.
- Unlock the engine control unit connector and pull it off.



- -> Press retaining lug to the right -arrow- and pull control unit out of bracket.

Installing

- Place the new control unit into the retaining frame.
- Install control unit connector and lock.
- Check the previous coding and the coding of the new control unit => Page 146 .

satelettronica

- Adapt new control unit to the electronic immobilizer.

=> Electrical system; Repair group 01; Immobilizer self-diagnosis; Adaption following renewal of engine control unit Immobilizer self-diagnosis Adaption following renewal of engine control unit

- Interrogate fault memory, if necessary, repair any faults and then erase fault memory => Page 10 , interrogating and erasing fault memory.
- Erase the learnt values and adapt the engine control unit again=> Page 147 .
- Perform idling speed check
  => Page 129 .
- Carry out test drive.

Observe the valid safety precautions when carrying out a road test => Page 93 .

During the road test the following operating conditions must be fulfilled:
- The coolant temperature must exceed 80 °C .
- When the temperature is reached, the operating conditions
  Idling
  Part throttle
  Enrichment
  Full throttle
  Overrun
  must be attained several times.

- Again interrogate the control unit fault memory.

4.5 - Coding engine control unit

Notes:

- A 5-character code must always be displayed during the control unit identification.
- Read measured value block 125 to see which control units are connected to engine control unit via data bus =>Page 68 , Evaluating measured value block, display groups 120...129 - Communication.
- The control unit must be recoded as follows if the vehicle relevant coding is not displayed or the control unit has been renewed.

Special tools, workshop equipment, testers, measuring instruments and auxiliary items required

- Fault reader V.A.G 1551 with cable V.A.G 1551/3

Test conditions

- The coolant temperature should only be a maximum of 80°C, =>display group 01, display zone 2

Work sequence

- Connect the fault reader V.A.G 1551 (V.A.G 1552). Then switch ignition on and select engine control unit with the "Address word" 01.
  (Connecting fault reader and selecting engine control unit => Page 4 .)

-> Indicated on display:

```
Rapid data transfer      HELP
Select function XXX
```

- Press keys 0 and 7 for the function "Code control unit" and confirm entry with Q key.

-> Indicated on display:

```
Coding control unit      Q
Enter code number XXXXX      (0-32000)
```

- Enter the relevant code number for this vehicle and confirm with Q key.

Protected by copyright. Copying for private or commercial purposes, in part or in whole, is not permitted unless authorised by Volkswagen AG. Volkswagen AG does not guarantee or accept any liability with respect to the correctness of information in this document. Copyright by Volkswagen AG.
satelettronica

Coding variations for engine control unit => Page 147 .

-> The control unit identification and the coding are indicated on the display, e.g.:

```
6K0906033A
```

- Press the ⇒key.
- Press keys 0 and 6 for the function "End output" and confirm entry with the Q key.
- Switch off ignition and wait for control unit run-on to end (approx. 25 seconds).

-> Indicated on display when a non-authorised code number has been entered.

```
Function is not recognised or cannot
be performed at the moment.
```

Note:

The engine control unit doesn't store the entered code (shown on display) until ignition has been switched off and control unit run-on has ended (25 seconds). Incorrect coding could lead to:

- Engine running faults (gear change jerks, load change jerks, etc.)
- Increased fuel consumption
- Increased emissions
- Faults stored in fault memory which are not actually present
- Reduced gearbox life
- Functions will not be performed (Lambda regulation, activation of the activated charcoal filter system, etc.).

4.6 - Coding variations of engine control unit

1st position: Vehicle code	2nd position: Emissions code	3rd position: Special code	4th position: Data bus code	5th position: Gearbox code
0 = No code	0 = No code	0 = No code	0 = No code	0 = No code
1 = ---	1 = ---	1 = ---	1 = Only ABS with data bus	1 = 5-speed manual gearbox
2 = ---	2 = ---	2 = ---	2 = Only airbag with data bus	2 = 6-speed manual gearbox
3 = ---	3 = ---	3 = ---	3 = ABS and airbag with data bus	3 = Automatic gearbox
4 = ---	4 = ---	4 = ---	4 = ---	4 = ---

Note:

At the moment only codings 00001 and 00011 can be performed, as the airbag system has not yet been equipped with data bus, there are only vehicles with 5-speed manual gearbox.

The code number is compiled as shown in the following example:

1st position: Vehicle code (no code at present)	0				
2nd position: Emissions code (no code at present)		0			
3rd position: Special code (no code a present)			0		
4th position: Data bus code (only ABS with data bus)				1	
5th position: Gearbox code (5-speed manual gearbox)					1
Code:	0	0	0	1	1

4.7 - Erasing learnt values and adapting engine control unit to throttle valve control part and exhaust gas recirculation valve

First of all, the old learnt values are erased. This is necessary to neutralise learnt values, which may be at the limit. During adaption (ignition switched on, engine not running), the engine control unit learns various positions

Protected by copyright. Copying for private or commercial purposes, in part or in whole, is not permitted unless authorised by Volkswagen AG. Volkswagen AG does not guarantee or accept any liability with respect to the correctness of information in this document. Copyright by Volkswagen AG.
satelettronica

of the throttle valve control part and exhaust gas recirculation valve. These positions are stored in the control unit.

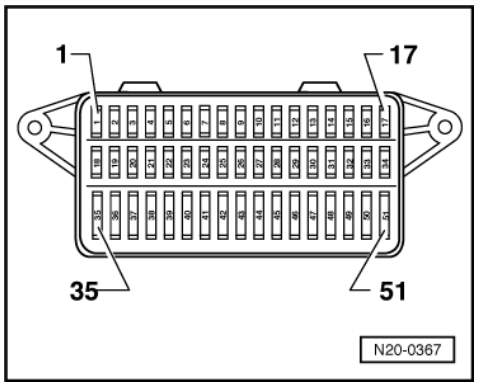
Adapting sequence must be performed if:

- The throttle valve control part has been removed and installed and cleaned if necessary.
- The throttle valve control part or the exhaust gas recirculation valve have been renewed.
- With a new engine, a new throttle valve control part or a new exhaust gas recirculation valve has been fitted.
- Defective components such as Lambda probes and injectors have been replaced.

Special tools, workshop equipment, testers, measuring instruments and auxiliary items required

- Fault reader V.A.G 1551 or vehicle system tester V.A.G 1552 with cable V.A.G 1551/3

Check conditions



- -> Fuses 13 and 36 must be OK.
- The battery voltage must be at least 11.5 V.
- Earth connection in plenum chamber OK.
- All electrical consumers, e.g. lights and rear window heating must be switched off
- If the vehicle is equipped with an air conditioning system, this must be switched off.
- The throttle valve must be at idling speed position (The accelerator must not be operated during the test).
- The throttle valve part must not be dirty (carbonization).
- No faults must be stored in fault memory => Page 10 , interrogating and erasing fault memory.
- The intake air temperature must be at least 6 °C =>display group 04, display zone 4.
- Coolant temperature must be 5...115 °C =>display group 01, display zone 2.

Work sequence

- Connect the fault reader V.A.G 1551 (V.A.G 1552). Then switch ignition on and select engine control unit with the "Address word" 01.
  (Connecting fault reader and selecting engine control unit => Page 4 .)

-> Indicated on display:

```
Rapid data transfer      HELP
Select function XXX
```

- Press keys 1 and 0 for function "Adaption" and confirm entry with Q key.

-> Indicated on display:

```
Adaption
Feed in channel number XX
```

- Press key 0 twice for "Channel number 0" and confirm entry with Q key.

-> Indicated on display:

```
Adaption     Q
Erase learnt values?
```

- Confirm input with Q key.

satelettronica
Protected by copyright. Copying for private or commercial purposes, in part or in whole is not permitted unless authorised by Volkswagen AG. Volkswagen AG does not guarantee or accept any liability with respect to the correctness of information in this document. Copyright by Volkswagen AG.

-> Indicated on display:

```
Adaption
Learnt values have been erased
```

- Press the ⇒key.

-> Indicated on display:

```
Rapid data transfer      HELP
Select function XXX
```

- Press keys 0 and 4 for the function "Introduction of basic setting" and confirm entry with Q key.

-> Indicated on display:

```
Basic setting
Input display group number XXX
```

- Press keys 0, 6 and 0 for the "Display group number 60" and confirm entry with Q key.

-> Indicated on display:
(1...4 = display zones)

```
System in basic setting      60
     xxx.x %     xxx.x %     x     ADP.
runs
```

After pressing the Q key the throttle valve positioner is switched so that it is not supplied with voltage at start of test.

In this condition the throttle valve is pulled into an emergency running position by a mechanical spring in the throttle valve control part. The values that both angle senders provide in the emergency running position are stored by the engine control unit.

Thereafter the throttle valve is opened a predetermined value. If this value is achieved, the throttle valve is again switched so that it is not supplied with voltage. Now the mechanical spring must pull the throttle valve to the previously learnt emergency running position within a predetermined period (spring test).

Then the throttle valve is closed by the throttle valve positioner and the values, which are supplied by the angle senders in the throttle valve control part are stored by the engine control unit.

If the engine control unit switches the throttle valve positioner so that it is without voltage during normal operation, this is indicated by the increased and hunting idling speed. The engine reacts slowly to accelerator changes.

-> Indicated on display:
(1...4 = display zones)

```
System in basic setting      60
     xx.x %     xx.x %     0     ADP. OK
```

Adapting has been performed successfully.

- End basic setting of throttle valve control part by pressing⇒ key.

-> Indicated on display:

```
Rapid data transfer      HELP
Select function XXX
```

- Press keys 0 and 4 for the function "Initiating basic setting" and confirm entry with Q key.

-> Indicated on display:

```
Basic setting
Input display group number XXX
```

- Press keys 0, 7 and 4 for the "Display group number 74" and confirm entry with Q key.

Copyright by Volkswagen AG. Volkswagen AG does not guarantee or accept any liability with respect to the correctness of information in this document. Copying for private or commercial purposes, in part or in whole, is not permitted unless authorised by Volkswagen AG.
satelettronica

-> Indicated on display:
(1...4 = display zones)

```
Basic setting      74
     xx.x %     xx.x %     xx.x %     ADP.
runs
```

Adapting will be performed.

-> Indicated on display:
(1...4 = display zones)

```
Basic setting      74
     xx.x %     xx.x %     xx.x %     ADP.
runs
```

Adapting has been performed successfully.

- End the engine basic setting by pressing the⇒ key.
- Press keys 0 and 6 for the function "End output" and confirm entry with the Q key.

To store the values:

- Switch off ignition and wait for control unit run-on to end (approx. 25 seconds).

Note:

If the basic setting of the control unit is interrupted, the cause could be one of the following:

- The test conditions are not met.
- Throttle valve cannot reach the mechanical stop because of contamination e.g. oil deposits.
- Throttle valve control part or wiring is defective => Page 108 Checking throttle valve control part.
- Exhaust gas recirculation valve or wiring is defective. Check exhaust gas recirculation valve =>Page 25 , Final control diagnosis.

After an interruption a fault is stored in fault memory. When next switching on ignition the basic setting is automatically performed again.

5 - Checking additional signals

5.1 - Checking additional signals

5.2 - Checking speed signal

Special tools, workshop equipment, testers, measuring instruments and auxiliary items required

- Hand multimeter V.A.G 1526 or multimeter V.A.G 1715
- Fault reader V.A.G 1551 (or vehicle system tester V.A.G 1552) with cable V.A.G 1551/3
- Adapter set V.A.G 1594
- Test box V.A.G 1598/31
- Current flow diagram

satelettronica

Check conditions

- -> Fuses 13 and 36 must be OK.
- The battery voltage must be at least 11.5 V.
- Earth connection in plenum chamber OK.
- All electrical consumers, e.g. lights and rear window heating must be switched off.
- If the vehicle is equipped with an air conditioning system, this must be switched off.
- No faults must be stored in fault memory => Page 10 , interrogating and erasing fault memory.
- Speedometer must be OK., checking speedometer:

=> Electrical system; Repair group 90

Test sequence

Note:

To check the speed signal the vehicle must be driven. To do this a second person is necessary.

Warning! Secure fault reader to rear seat and operate from this position.

Observe the valid safety precautions when carrying out a road test => Page 93 .

- Connect fault reader V.A.G 1551 (V.A.G 1552). Start engine and select "Address word" 01 of engine control unit. When doing this the engine must be running at idling speed.
  (Connecting fault reader and selecting engine control unit => Page 4 .)

-> Indicated on display:

```
Rapid data transfer      HELP
Select function XXX
```

- Press keys 0 and 8 for the function "Read measured value block" and confirm entry with Q key.

-> Indicated on display:

```
Read measured value block
Input display group number XXX
```

- Press keys 0, 0 and 5 for "Display group number 5" and confirm entry with Q key.

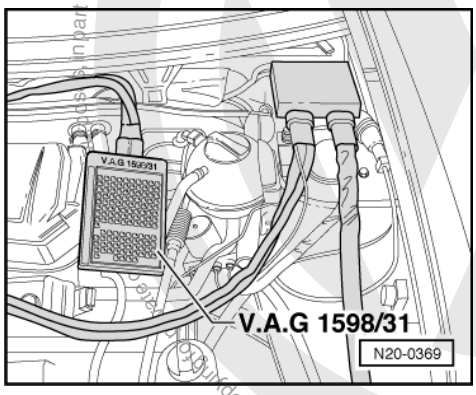
-> Indicated on display:
(1...4 = Display zones)

```
Read measured value block 5
     1      2      3      4
```

- Carry out test drive with a 2nd person to observe display.
- Observe figure displayed in display zone 3:
  Specification: approx. driven speed
- Drive slower. The displayed value must
  decrease.
- Press the ⇒key.
- Press keys 0 and 6 for the "End output" function and confirm input with the Q key.
- Switch off ignition.

If no speed is indicated or the display values reduce when driving slowly:

- Remove left cover for plenum chamber.



Protected by copyright. Copyright by Volkswagen AG.
Copyright by Volkswagen AG. Volkswagen AG does not guarantee or accept any liability with respect to the correctness of information in this document.
satelettronica

- -> Connect test box V.A.G 1598/31 to control unit wiring harness. The engine control unit remains disconnected.
- Connect multimeter for voltage measurement between test box sockets 3 (positive) + 9 (speed signal).
- Raise front left side of vehicle.
- Switch on ignition.
- Rotate front wheel and observe voltage display.
  Specification: 0.0...at least 4.0 Volt fluctuating

Note:

If necessary, hold the front right wheel to prevent it from turning.

If the display does not fluctuate:

- Check wiring from test box socket 9 to dash panel insert for open or short circuit referring to current flow diagram:

=> Current flow diagrams, Electrical fault finding and Fitting locations

5.3 - Checking engine speed signal

Function

The engine rpm signal output is on contact 22 of engine control unit. Amongst other things the signal is necessary for the rev. counter in dash panel insert.

Special tools, workshop equipment, testers, measuring instruments and auxiliary items required

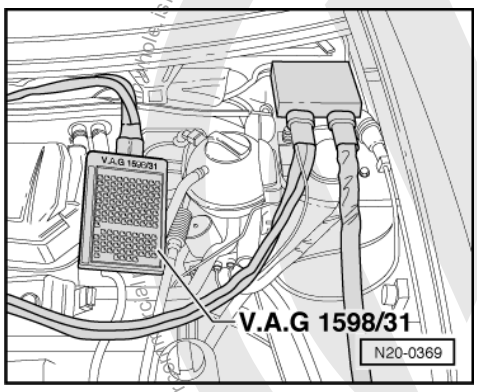
- Hand multimeter V.A.G 1526 or multimeter V.A.G 1715
- Adapter set V.A.G 1594
- Test box V.A.G 1598/31
- Current flow diagram

Test conditions

- No faults must be stored in fault memory => Page 10 , interrogating and erasing fault memory.

Test sequence

- Remove left cover for plenum chamber.



- -> Connect test box V.A.G 1598/31 to control unit wiring harness. The engine control unit remains disconnected.
- Check wiring from test box contact 22 to dash panel insert for open circuit referring to current flow diagram:

=> Current flow diagrams, Electrical fault finding and Fitting locations

Protected by copyright. Copying for private or commercial purposes, in part or in whole, is not permitted unless authorised by Volkswagen AG.
satelettronica

5.4 - Checking signal from/to air conditioning system

Function

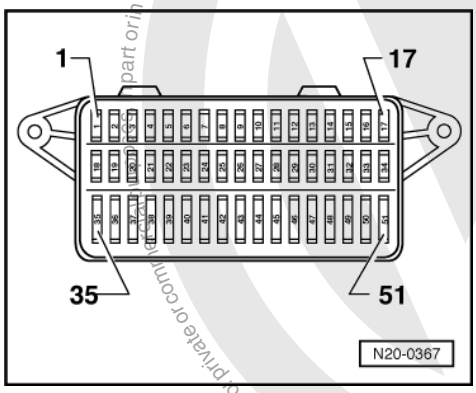
Air conditioner compressor signal:
Just before the air conditioner compressor is switched on, the voltage is sent to the engine control unit. The signal ensures that once the air conditioner is switched on, idling speed will not drop drastically.

Switching off air conditioner compressor:
In order that engine performance is not impaired when accelerating, the A/C compressor is switched off briefly when accelerating from start or from low engine revs.

Air conditioner readiness:
When the air conditioner is switched on the engine control unit receives the information: air conditioning system is switched on. This "PWM signal" (pulse width modulation) can be used to pre-control the idling speed.

Special tools, workshop equipment, testers, measuring instruments and auxiliary items required

- Hand multimeter V.A.G 1526 or multimeter V.A.G 1715
- Fault reader V.A.G 1551 (or vehicle system tester V.A.G 1552) with cable V.A.G 1551/3
- Adapter set V.A.G 1594
- Test box V.A.G 1598/31
- Current flow diagram



Test conditions

- -> Fuses 13 and 36 must be OK.
- The battery voltage must be at least 11.5 V.
- Earth connection in plenum chamber OK.
- All electrical consumers, e.g. lights and rear window heating must be switched off.
- Air conditioner functioning OK.
- Air conditioner must be switched off
- Vehicle at room temperature (warmer than + 15 °C).
- No faults must be stored in fault memory => Page 10 , interrogating and erasing fault memory.

Test sequence

- Connect fault reader V.A.G 1551 (V.A.G 1552). Start engine and select "Address word" 01 of engine control unit. When doing this the engine must be running at idling speed.
  (Connecting fault reader and selecting engine control unit => Page 4 .)

-> Indicated on display:

```
Rapid data transfer      HELP
Select function XXX
```

- Press keys 0 and 8 for the function "Read measured value block" and confirm entry with Q key.

-> Indicated on display:

satelettronica

```
Read measured value block
Input display group number XXX
```

Checking air conditioner compressor signal and air conditioner switch-off

- Press keys 0, 5 and 0 for "Display group number 50" and confirm entry with Q key.

-> Indicated on display:
(1...4 = Display zones)

```
Read measured value block 50
     1      2      3      4
```

- Check displays in display zones 3 and 4:

  Display in display zone 3:
  Off
  Display in display zone 4:
  Compr.OFF

- Switch on air conditioning system.
- Select lowest temperature and highest blower speed.

  The display in display zone 3 must change to
  on.
  Display in display zone 4 must change to
  Compr.ON.

- Carry out test drive with a 2nd person to observe display.

Observe the valid safety precautions when carrying out a road test => Page 93 .

Note:
A road test is required to test the shut-off function.

- Engage 1st gear and accelerate moderately hard. Then release accelerator pedal.

  The display in display zone 4 must change from
  Compr.ON
  to
  Compr. OFF
  for a few seconds (compressor switch-off when vehicle is accelerating), during which the display in display zone 3 must remain constantly at "on".

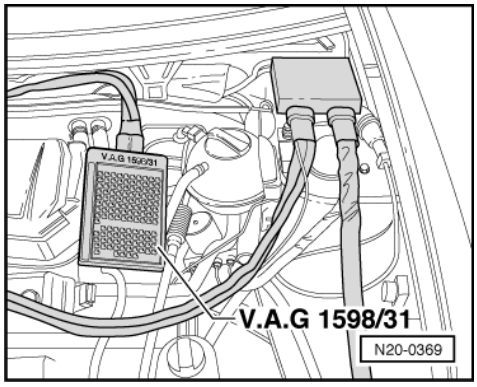
- Press the ⇒key.
- Switch off air conditioning system.

If the display changes as described:

- Checking air conditioner readiness => Page 155 .

If the displays do not change as described:

- Press keys 0 and 6 for the "End output" function and confirm input with the Q key.
- Switch off ignition.
- Remove left cover for plenum chamber.



Protected by copyright. Copying for private or commercial purposes, in part or in whole, is not permitted unless authorised by Volkswagen AG. Volkswagen AG does not guarantee or accept any liability with respect to the correctness of information in this document. Copyright by Volkswagen AG.
satelettronica

- -> Connect test box V.A.G 1598/31 to control unit wiring harness. The engine control unit remains disconnected.
- Check wiring between test box sockets 76 and the air conditioner for open circuit using current flow diagram.
  Wire resistance: Max. 1.5 ω
- Check the wire between text box socket 28 and the air conditioner for open circuit using current flow diagram.
  Wire resistance: Max. 1.5 ω

Checking air conditioner readiness

Note:

The engine control unit receives a "PWM signal" from air conditioning system high pressure sender (G65), this allows the idling speed signal to be regulated more precisely.

- Press keys 0 and 8 for the function "Read measured value block" and confirm entry with Q key.

-> Indicated on display:

```
Read measured value block
Input display group number XXX
```

- Press keys 0, 5 and 7 for "Display group number 57" and confirm entry with Q key.

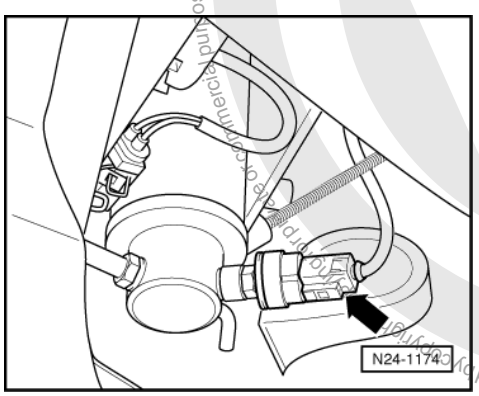
-> Indicated on display:
(1...4 = Display zones)

```
Read measured value block 57
     1     2     3     4
```

- Observe display in display zone 4. It must show
  0...2 %
- Switch on air conditioning system.
- Select lowest temperature and highest blower speed.

  The display in display zone must change to
  15...80% (fluctuating).

- Press the ⇒key.
- Press keys 0 and 6 for the "End output" function and confirm input with the Q key.



- Switch off ignition.

If the display does not change or the value remains constant:

- -> Pull 3-pin connector off air conditioning system high pressure switch (G65) -arrow-.

satelettronica

- -> Connect test box V.A.G 1598/31 to control unit wiring harness. The engine control unit remains disconnected.

- -> Check wiring for open circuit between test box and 2-pin connector using current flow diagram:
  Contact 1 and test box socket 30
  Contact 2 and test box socket 49
  Wire resistance: max. 1.5 ω
- Additionally check wires for short to one another, to vehicle earth and to battery positive.
  Specification: ∞ω

If no fault is detected in the wiring:

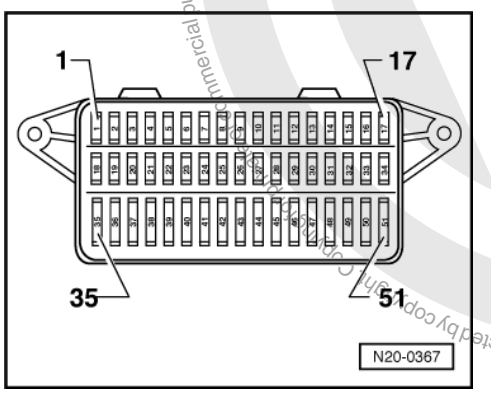
- Replace engine control unit
  => Page 145 .

5.8 - Checking starter signal

Special tools, workshop equipment, testers, measuring instruments and auxiliary items required

- Hand multimeter V.A.G 1526 or multimeter V.A.G 1715
- Adapter set V.A.G 1594
- Test box V.A.G 1598/31
- Current flow diagram

Test conditions

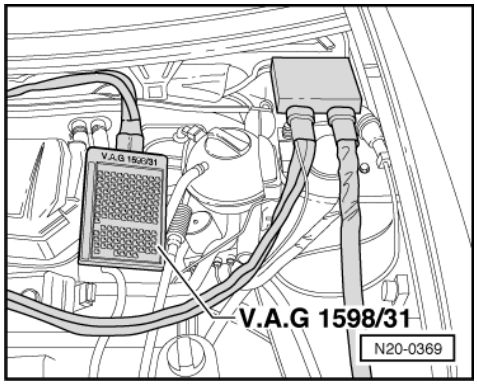


- -> Fuses 13 and 36 must be OK.
- The battery voltage must be at least 11.5 V.
- Earth connection in plenum chamber OK.
- All electrical consumers, e.g. lights and rear window heating must be switched off.
- If the vehicle is equipped with an air conditioning system, this must be switched off.

Protected by copyright. Copyright by Volkswagen AG. Volkswagen AG does not guarantee or accept any liability with respect to the correctness of information in this document. Copyright by Volkswagen AG.
satelettronica

Test sequence

- Remove left cover for plenum chamber.



- -> Connect test box V.A.G 1598/31 to control unit wiring harness. The engine control unit remains disconnected.
- Connect multimeter to measure voltage between test box sockets 55 (positive) + earth.
- Get a 2nd person to operate the starter. Observe voltage display.
  Specification: at least 8.0 V

If the specification is not obtained:

- Check wiring connection from test box socket 55 to starter (terminal 50) for open and short circuit using current flow diagram:

=> Current flow diagrams, Electrical fault finding and Fitting locations

- Interrogate fault memory, if necessary, repair any faults and then erase fault memory => Page 10 , interrogating and erasing fault memory.

5.9 - Checking data bus

Function

Data bus-compatible control units are connected together via two data bus wires twisted together (CAN high and CAN low) and exchange information (messages). Information not available in the data bus will be recognised as a fault by the engine control unit as well as other CAN data bus control units.

The CAN data bus requires a matching resistor of 66ω to function fault free. This matching resistor is located in the engine control unit.

Further information:

=> Self study programme No. 186 "The CAN data bus".

Special tools, workshop equipment, testers, measuring instruments and auxiliary items required

- Hand multimeter V.A.G 1526 or multimeter V.A.G 1715
- Adapter set V.A.G 1594
- Test box V.A.G 1598/31
- Current flow diagram

Test conditions

- A fault has been recognised by the CAN data bus self-diagnosis.

Copyright by Volkswagen AG. Volkswagen AG does not guarantee or accept any liability with respect to the correctness of information in this document. Copying for private or commercial purposes, in part or in whole, is not permitted unless authorised by Volkswagen AG.
satelettronica

Test sequence

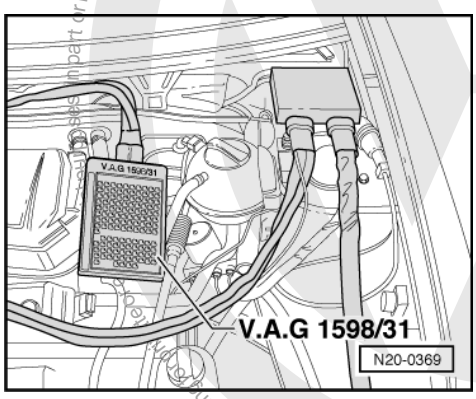
- Remove left cover for plenum chamber.
- Unlock the engine control unit connector and pull it off.
- Connect test box V.A.G 1598/31 to engine control unit. The control unit wiring harness is not connected by this action.
- Check centralized matching resistor in engine control unit.
- Measure resistance between
  Test box socket 39 and 40:
  Specification: 60.0...72.0 ω

If the resistance measurement is outside the specified range:

- Replace engine control unit
  => Page 145 .

If the resistance value is within the specified range:

- Pull test box V.A.G 1598/31 off engine control unit.



- -> Connect test box V.A.G 1598/31 to control unit wiring harness. The engine control unit remains disconnected.
- Check the CAN data bus wiring for short to one another:
- Pull wiring harness off all other control units/components which are networked via this data bus.

=> Current flow diagrams, Electrical fault finding and Fitting locations

- Then measure resistance again between:
  Test box sockets 39 and 40:
  Specification: ∞ ω

If the specification is not obtained (wires have short to one another):

- Repair the fault in the wiring using current flow diagram:

=> Current flow diagrams, Electrical fault finding and Fitting locations

If the specification is obtained (wires do not have a short to one another):

- Check wiring to the individual data bus components for open circuit, short to positive and earth using current flow diagram:

=> Current flow diagrams, Electrical fault finding and Fitting locations

satelettronica

28 - Ignition system

1 - Servicing ignition system

1.1 - Servicing ignition system

1.2 - General notes on ignition system

- Only the components which specifically relate to the ignition system are dealt with here. For the other components of the injection and ignition system => Repair group 24.
- Disconnecting and connecting the battery must only be done with the ignition switched off, otherwise the engine control unit could be damaged.
- The engine control unit is equipped with self diagnosis.
- Components marked with * are checked via the self diagnosis
  => Page 10 , interrogating and erasing fault memory.
- For trouble-free operation of the electrical components a voltage of at least 11.5 V is necessary.
- Before carrying out repairs and for fault finding, interrogate fault memory => Page 10 , interrogating and erasing fault memory
- During some checks it is possible that the control unit will recognise and store a fault. Therefore after completing all checks and repairs the fault memory must be interrogated and if necessary erased.
  => Page 10 , interrogating and erasing fault memory

- If the engine starts, runs for a short period and then stops after fault finding, repairs or component tests, then the fault may lie with the immobilizer which is blocking the engine control unit. The fault memory must be interrogated and if necessary the control unit matched:

=> Electrical system; Repair group 01; Immobilizer self-diagnosis; Adaption following renewal of engine control unit Immobilizer self-diagnosis Adaption following renewal of engine control unit

1.4 - Safety precautions

To prevent injuries to persons and/or damage to the injection and ignition system, the following must be observed:

- Do not touch or pull off ignition wiring when engine is running or turning at starter speed.
- The ignition must be switched off when disconnecting or connecting injection and ignition system wiring as well as test instrument cables.
- If the engine is to be turned at starter speed, without starting:

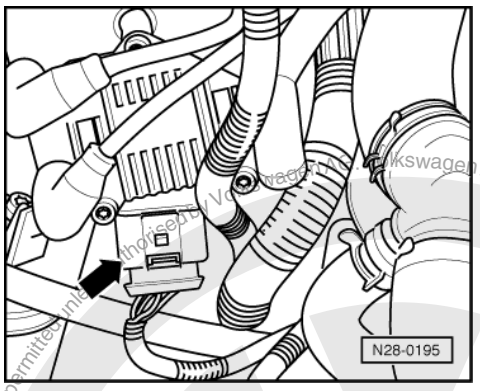
satelettronica



-> Pull 4 pin connector off ignition transformer (N152) -arrow-.

Observe following if test and measuring instruments are required during a test drive:

- Test and measuring instruments must be secured to rear seat and operated by a 2nd person from this location.

  If test and measuring instruments are operated from front passenger's seat and the vehicle is involved in an accident, there is a possibility that the person sitting in this seat may receive serious injuries when the airbag is triggered.

1.5 - Test data, spark plugs

Engine code	APF
Firing order	1-3-4-2
Spark plugs1)2)

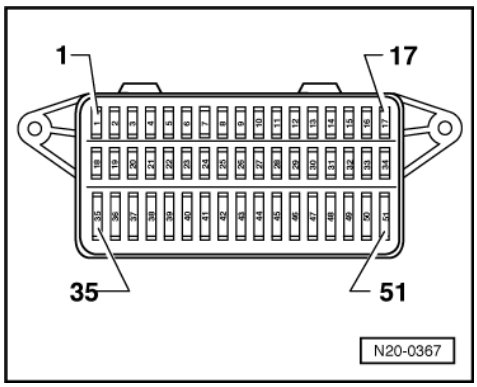
satelettronica



Check conditions

- -> Fuses 13 and 36 must be OK.
- The battery voltage must be at least 11.5 V.
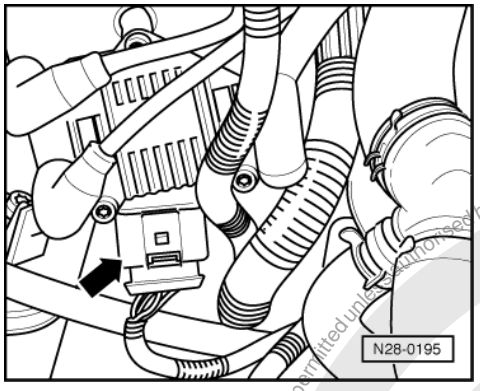
- Earth connection in plenum chamber OK.
- All electrical consumers, e.g. lights and rear window heating must be switched off.
- If the vehicle is equipped with an air conditioning system, this must be switched off.
- Engine speed sender must be OK, checking =>Page 116 .

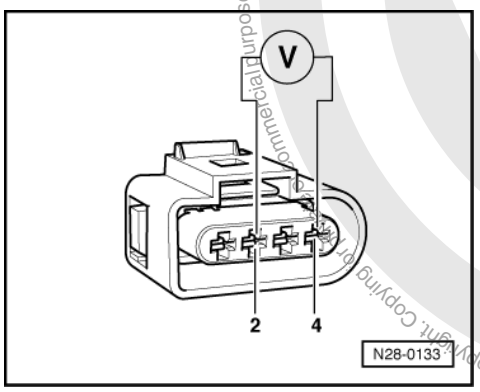


- The Hall sender must be OK, checking => Page 175 .

Test sequence

- -> Pull 4 pin connector off ignition transformer (N152) -arrow-.

Checking voltage supply



- -> Using multimeter and adapter cables from V.A.G 1594 measure the supply voltage between contacts 2 (positive) + 4 (earth) of disconnected connector.
- Switch on ignition.
  Specification: min. 11.5 V

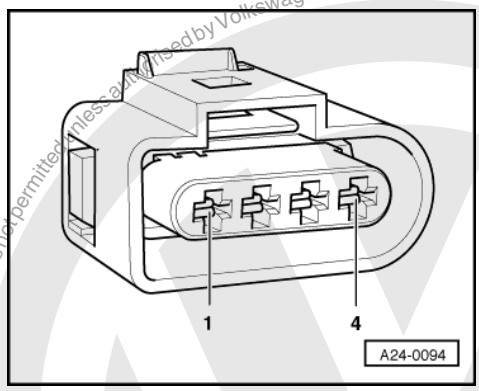
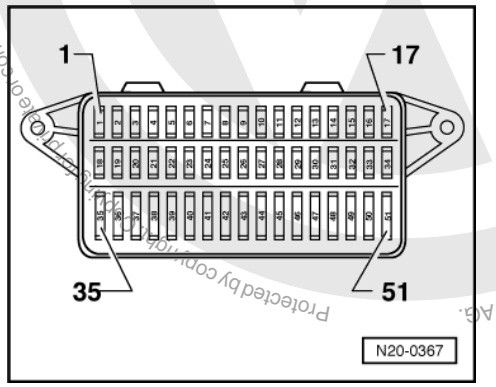
- Switch off ignition.

If no voltage is present:



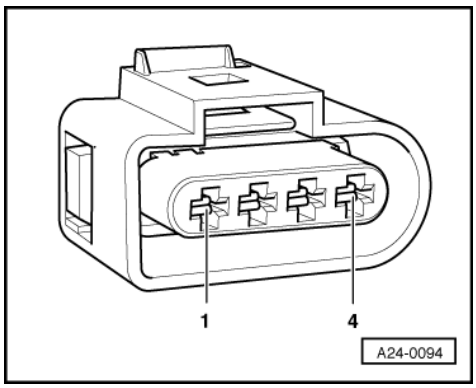
- -> Check wire between 4 pin connector contact 2 and relay plate for open circuit according to current flow diagram.
  Wire resistance: max. 1.5 ω
- Check wire between 4 pin connector contact 4 and earth for open circuit according to current flow diagram.
  Wire resistance: max. 1.5 ω



Checking activation

Warning! During the following test do not touch the terminals of the ignition transformer or test cables.

- -> Pull fuel pump fuse No. 40 out of fuse holder.



- -> Connect diode test lamp V.A.G 1527 with adapter cables from V.A.G 1594 to
  contacts 1 + 4 (ignition output 1),
  contacts 3 + 4 (ignition output 2)
  of disconnected connector.
- Get a 2nd person to operate starter and check the ignition signal from engine control unit.
  The LED must flicker

satelettronica

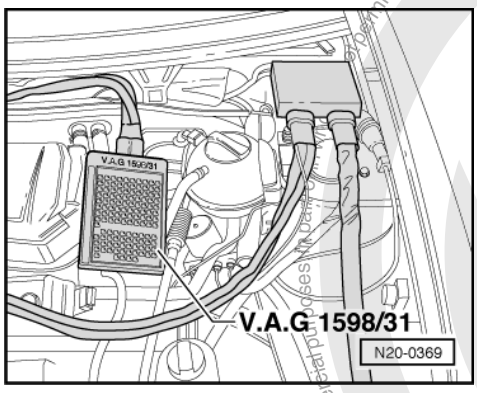
- Switch off ignition.
- Fit fuel pump fuse No. 40 into fuse holder.

If the LED flickers and there is voltage between contacts 2 + 4:

- Replace ignition transformer (N152)
  => Page 171 , item 1 .

Note:

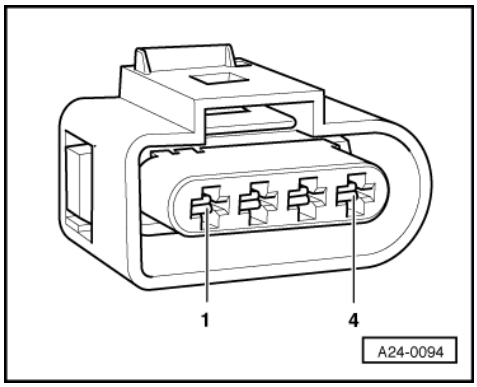
The ignition transformer and output stage are combined in a single component and cannot be renewed separately.



- Interrogate fault memory, if necessary, repair any faults and then erase fault memory => Page 10 , interrogating and erasing fault memory.

The LED does not flicker:

- Remove left cover for plenum chamber.
- -> Connect test box V.A.G 1598/31 to control unit wiring harness. The engine control unit remains disconnected.



- -> Check wiring for open circuit between test box and 4-pin connector referring to current flow diagram.
  Contact 1 and test box socket 112
  Contact 3 and test box socket 113
  Wire resistance: max. 1.5 ω
- Additionally check wires for short to one another, to vehicle earth and to battery positive.
  Specification: ∞ω

If no wiring fault is detected and voltage was present between contacts 2+4:

- Replace engine control unit
  => Page 145 .

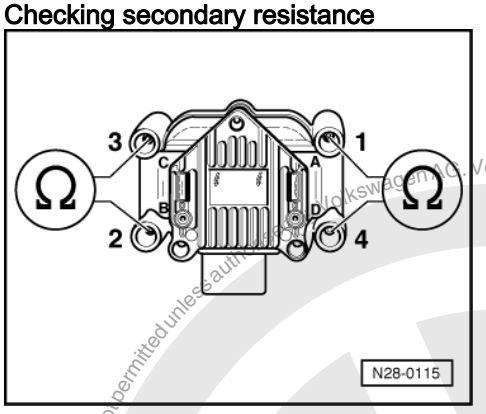
satelettronica

Checking secondary resistance



- -> Check the secondary resistance on terminal 4 between
  Cyl. 1+Cyl. 4,
  Cyl. 2+Cyl. 3.
  Specification: 4.0... 6.0 kω (at room temperature)

If the specifications are not attained:
- Replace ignition transformer (N152)
  => Page 171 , item 1 .

Note:
The ignition transformer and output stage are combined in a single component and cannot be renewed separately.
- Interrogate fault memory, if necessary, repair any faults and then erase fault memory => Page 10 , interrogating and erasing fault memory.

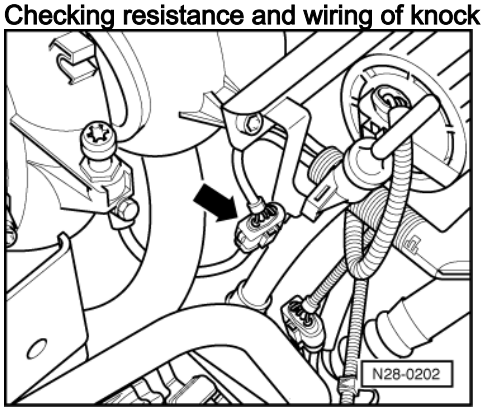
1.8 - Checking knock sensor

Notes:
- It is extremely important to keep to the tightening torque of 20 Nm to ensure the knock sensors perform perfectly.
- The knock sensor might misinterpret vibrations of loose components as knocking. Therefore check that engine ancillaries are securely mounted.
- Only gold-plated contacts may be used when servicing the knock sensor connector contacts.

Special tools, workshop equipment, testers, measuring instruments and auxiliary items required
- Hand multimeter V.A.G 1526 or multimeter V.A.G 1715
- Adapter set V.A.G 1594
- Test box V.A.G 1598/31
- Current flow diagram

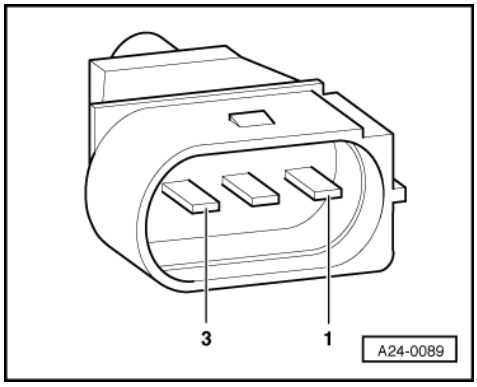
Test conditions
- Self-diagnosis has detected a fault on the knock sensor =>Page 10 , Interrogating and erasing fault memory.

Checking resistance and wiring of knock sensor



satelettronica

- -> Disconnect black 3-pin connector for knock sensor 1 (G61) -arrow-.

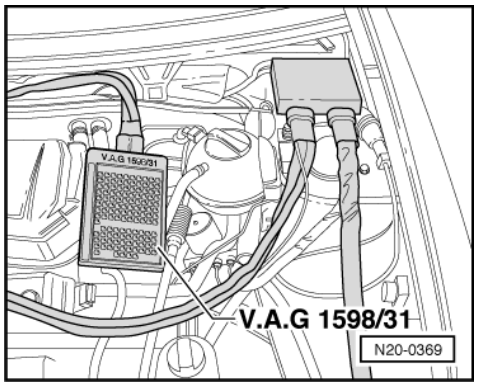


- -> Measure resistance between contacts 1 + 2, 1 + 3 and 2 + 3 of knock sensor connector.
  Specification: ∞ω

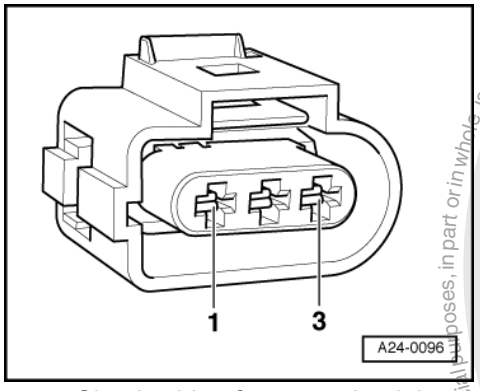
If the specification is not obtained:

- Replace knock sensor (G61) =>Page 172 , item 5 .
- Interrogate fault memory, if necessary, repair any faults and then erase fault memory => Page 10 , interrogating and erasing fault memory.

If no fault in knock sensor is detected:



- Remove left cover for plenum chamber.
- -> Connect test box V.A.G 1598/31 to control unit wiring harness. The engine control unit remains disconnected.



- -> Check wiring for open circuit between test box and 3-pin connector using current flow diagram.
  Contact 1 and test box socket 109
  Contact 2 and test box socket 101
  Contact 3 and test box socket 100
  Wire resistance: max. 1.5 ω
- Additionally check wires for short to one another, to vehicle earth and to battery positive.

satelettronica

Specification: ∞ω

If no fault is detected in the wiring:

- Loosen knock sensor and tighten again to 20 Nm.
- Carry out test drive.

Observe the valid safety precautions when carrying out a test drive => Page 174 .

During the road test the following operating conditions must be fulfilled:
- The coolant temperature must exceed 80 °C .
- When the temperature is reached, the operating conditions
  - Idling
  - Part throttle
  - Enrichment
  - Full throttle
  - Overrun

  must be attained several times.
- At full throttle the speed must exceed 3500 rpm.

- Again interrogate the control unit fault memory.

If the fault is still present:

- Replace knock sensor (G61) =>Page 172 , item 5 .
- Interrogate fault memory, if necessary, repair any faults and then erase fault memory => Page 10 , interrogating and erasing fault memory.

1.9 - Check misfiring recognition

Special tools, workshop equipment, testers, measuring instruments and auxiliary items required

◆ Fault reader V.A.G 1551 or vehicle system tester V.A.G 1552 with cable V.A.G 1551/3

Test sequence

- Connect fault reader V.A.G 1551 (V.A.G 1552). Start engine and select "Address word" 01 of engine control unit. When doing this the engine must be running at idling speed.
  (Connecting fault reader and selecting engine control unit => Page 4 .)

-> Indicated on display:

```
Rapid data transfer      HELP
Select function XXX
```

- Press keys 0 and 8 for the function "Read measured value block" and confirm entry with Q key.

-> Indicated on display:

```
Read measured value block
Input display group number XXX
```

- Press keys 0, 1 and 4 for "Display group number 14" and confirm entry with Q key.

-> Indicated on display:
(1...4 = Display zones)

```
Read measured value block 14
     1     2     3     4
```

- Check misfire recognition status in display zone 4.
  Specification: "activated"
- Check total number of misfires since engine was started in display zone 3:

satelettronica

Specification: 0...20

Note:

The specification is only valid for a period of max. 5 minutes after the engine was started.

If the specifications are obtained:

- Press ⇒key.
- Press keys 0 and 6 for the "End output" function and confirm input with the Q key.
- Switch off ignition.

If the specifications are not attained:

- Change to display group 15 as follows:
  V.A.G 1551: Press key 3
  V.A.G 1552: Press key ↑

-> Indicated on display:
(1...4 = Display zones)

```
Read measured value block 15
     1     2     3     4
```

- Check misfire recognition status in display zone 4.
  Specification: "activated"
- Check misfiring of cyl. 1...cyl. 3 since engine was started in display zones 1...3.
  Specification: 0...5

Note:

The specification is only valid for a period of max. 5 minutes after the engine was started.

If the specifications are not obtained:

- Press ⇒key.
- Press keys 0 and 6 for the "End output" function and confirm input with the Q key.
- Switch off ignition.
- =>Page 57 , Evaluating display group 15 and display group 16.

If the specifications are obtained:

- Change to display group 16 as follows:
  V.A.G 1551: Press key 3
  V.A.G 1552: Press key ↑

-> Indicated on display:
(1...4 = Display zones)

```
Read measured value block 16
     1     2     3     4
```

- Check misfire recognition status in display zone 4.
  Specification: "activated"
- Check misfiring of cyl. 4 since engine was started in display zone 1
  Specification: 0...5
- Press ⇒key.
- Press keys 0 and 6 for the "End output" function and confirm input with the Q key.
- Switch off ignition.

If the specification is not attained:

- =>Page 57 , Evaluating display group 15 and display group 16.
